

# CE103 Algorithms and Programming I

## Week-4

# Introduction to Code Reusability and Automated Testing

During this course we will use entry level of shared library development and their tests and test automations. Also we will see TDD(Test Driven Development) approach.

During this course we will use **Windows OS, Eclipse and Visual Studio Community Edition** environments for examples.

Each example will include two function

"Hello <name>" printing function with name sayHelloTo(name) and sum of two variable function for basic, sum = sum(a,b).

This sum function will add a to b and return result to sum variable.

We will locate them in library and use them from a console application, also we will create unit tests for testing their functionalities and return variables

# Shared Library Development

## C Programming (Static Library)

### Visual Studio Community Edition

In this sample we will create **c-lib-sample** project that contains library, executable, unit tests and unit test runners.

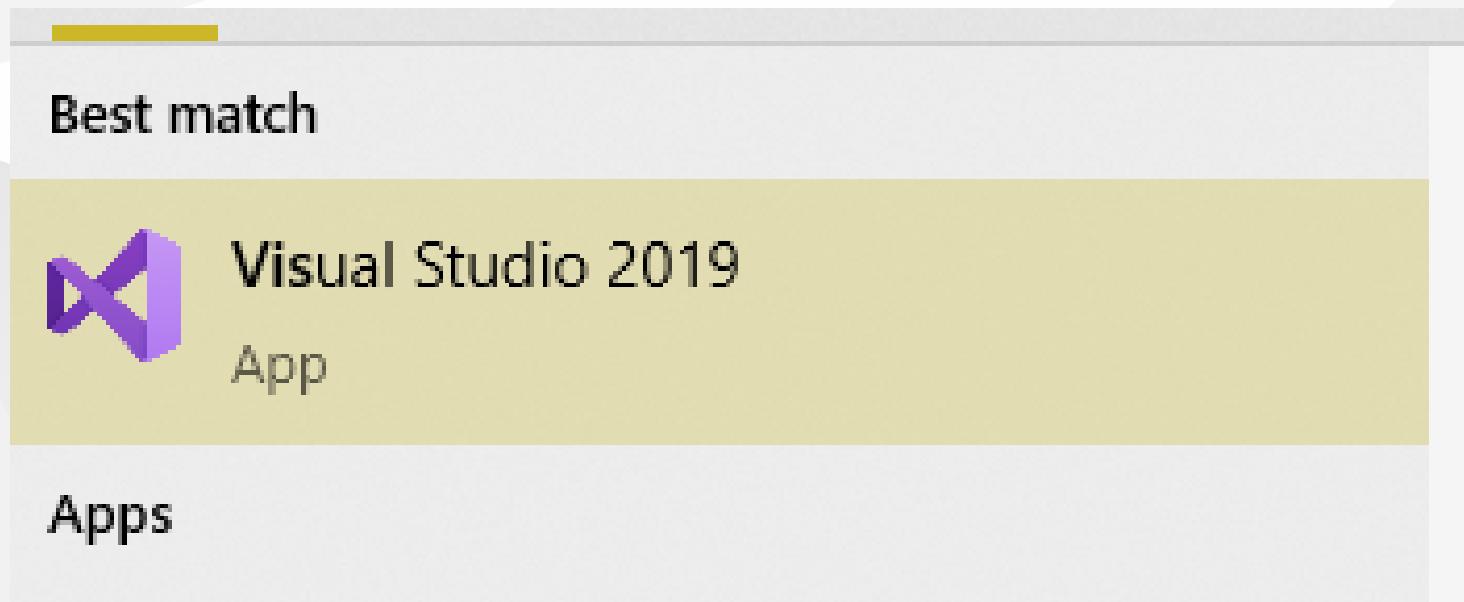

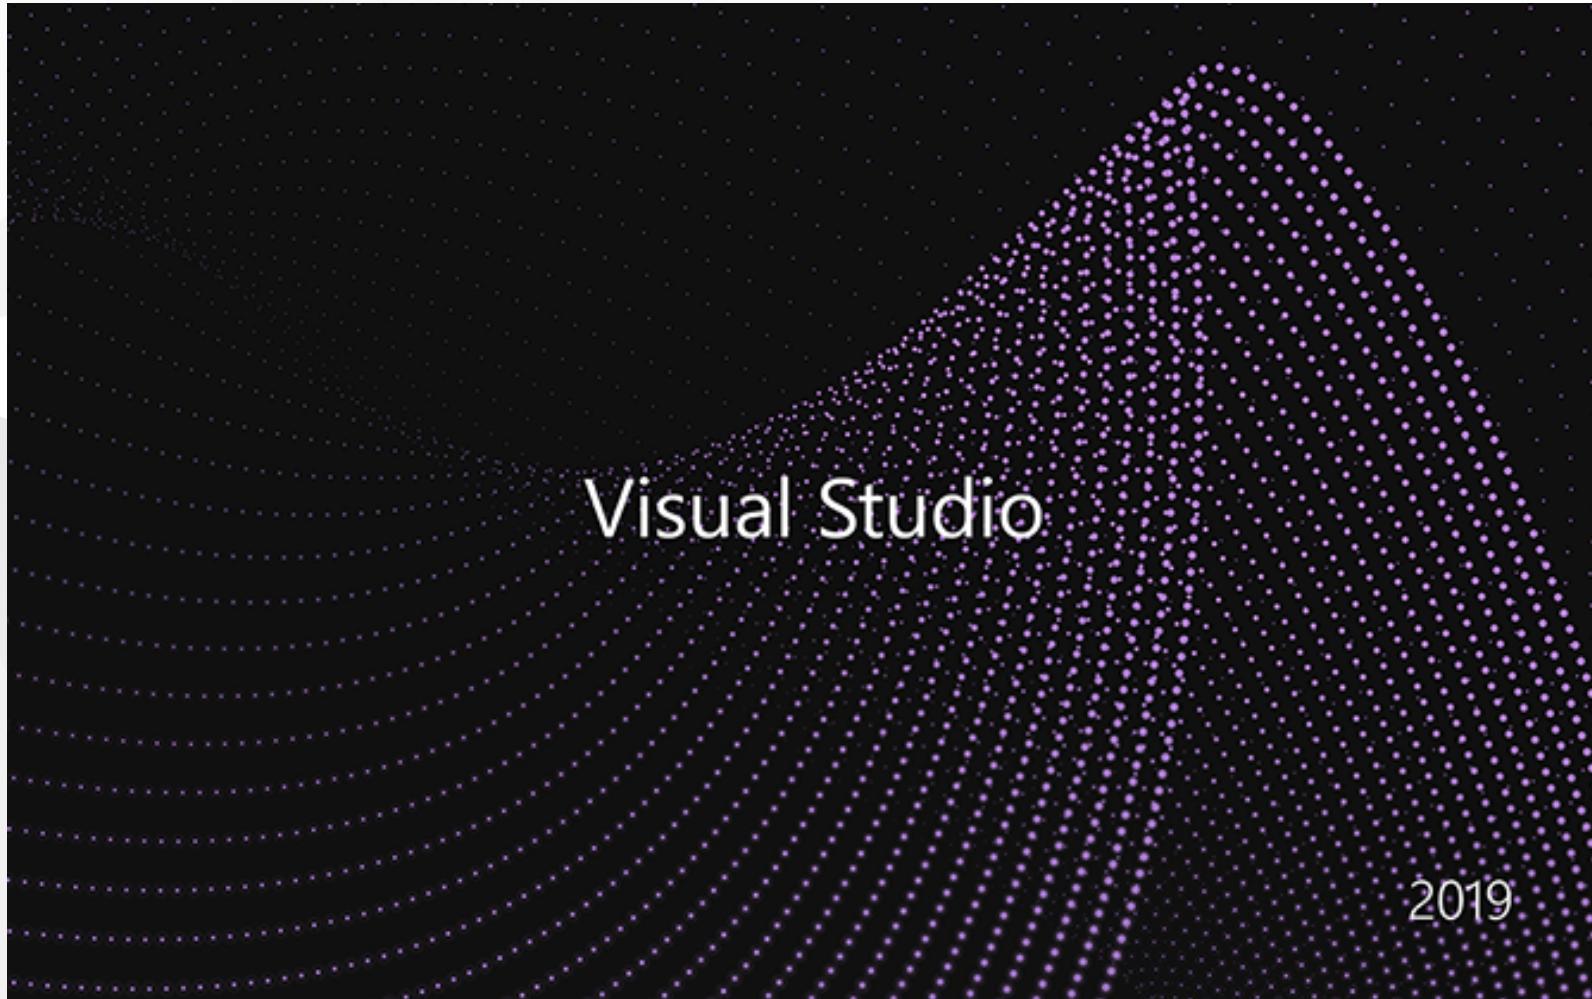

First of all you install Visual Studio Community Edition from website

[Visual Studio 2019 Community Edition - Son Ücretsiz Sürümü İndir](#)

Open visual studio community edition and select create a new project

## Select create a new project

### Get started

#### Clone a repository

Get code from an online repository like GitHub or Azure DevOps

#### Open a project or solution

Open a local Visual Studio project or .sln file

#### Open a local folder

Navigate and edit code within any folder

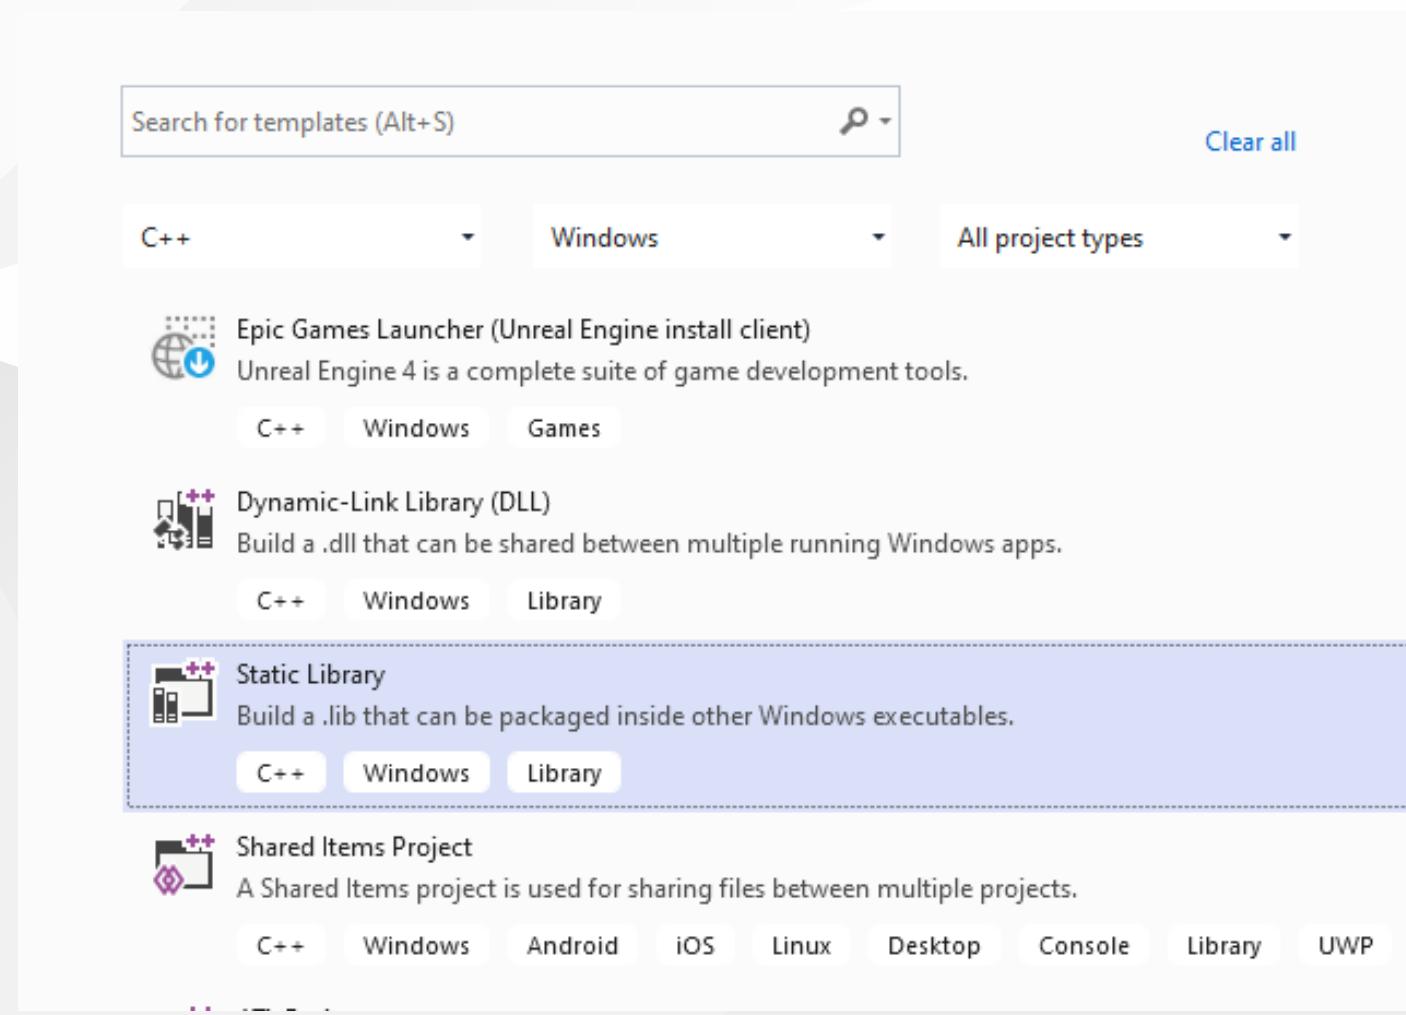

#### Create a new project

Choose a project template with code scaffolding to get started

[Continue without code →](#)

## Select C++ static library from project list

## Name static library project

### Configure your new project

Static Library   C++   Windows   Library

Project name

c-sample-lib

Location

E:\UgurCoruh\RTEU\Lectures\2021-2022 Güz CE103 - Algorithms and Programming \Lectures\ce11

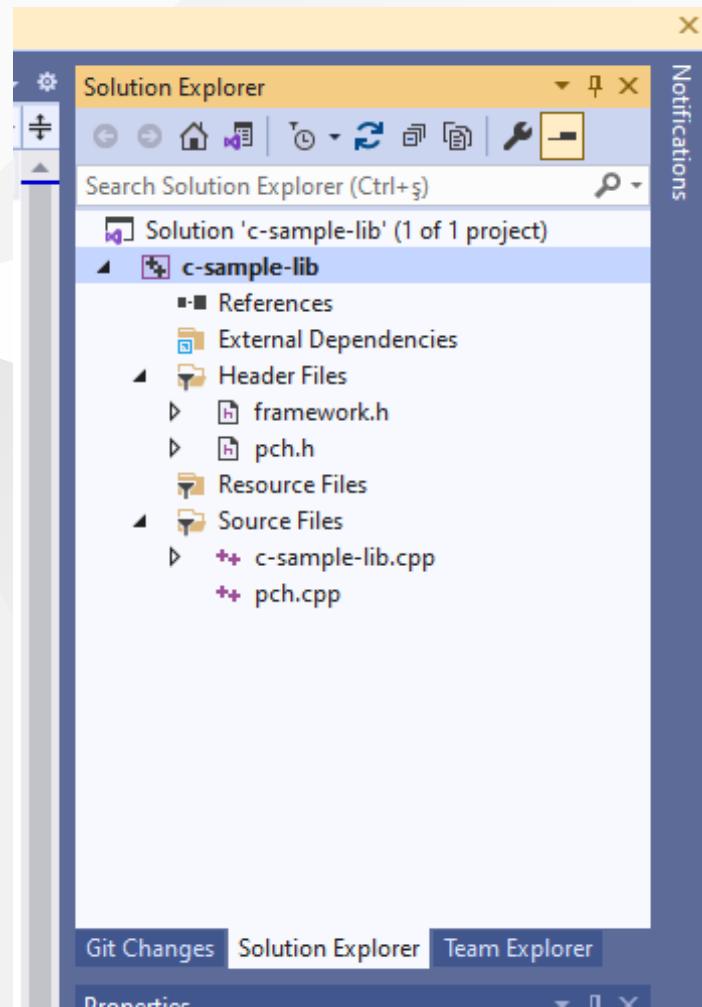

...

Solution name i

c-sample-lib

Place solution and project in the same directory

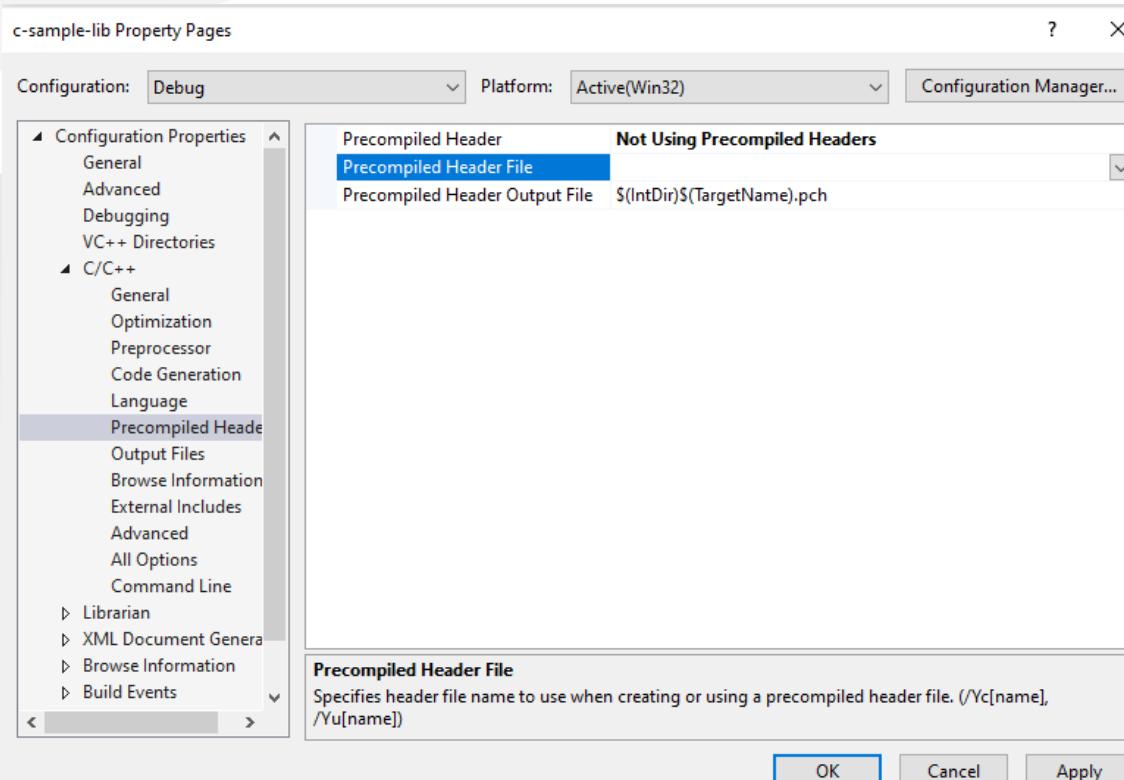

## Default configuration come with C++ project types and setting

In the c-sample-lib.cpp you will sample function

```
void fnCSampleLib()  
{  
}  
}
```

Delete pch.h and pch.c files. Also disable use precompiled header settings from configurations and change to "Not Using Precomplied Headers", also you can delete precomplied Header File.

# Customize library header name and update "framework.h" to "samplelib.h"

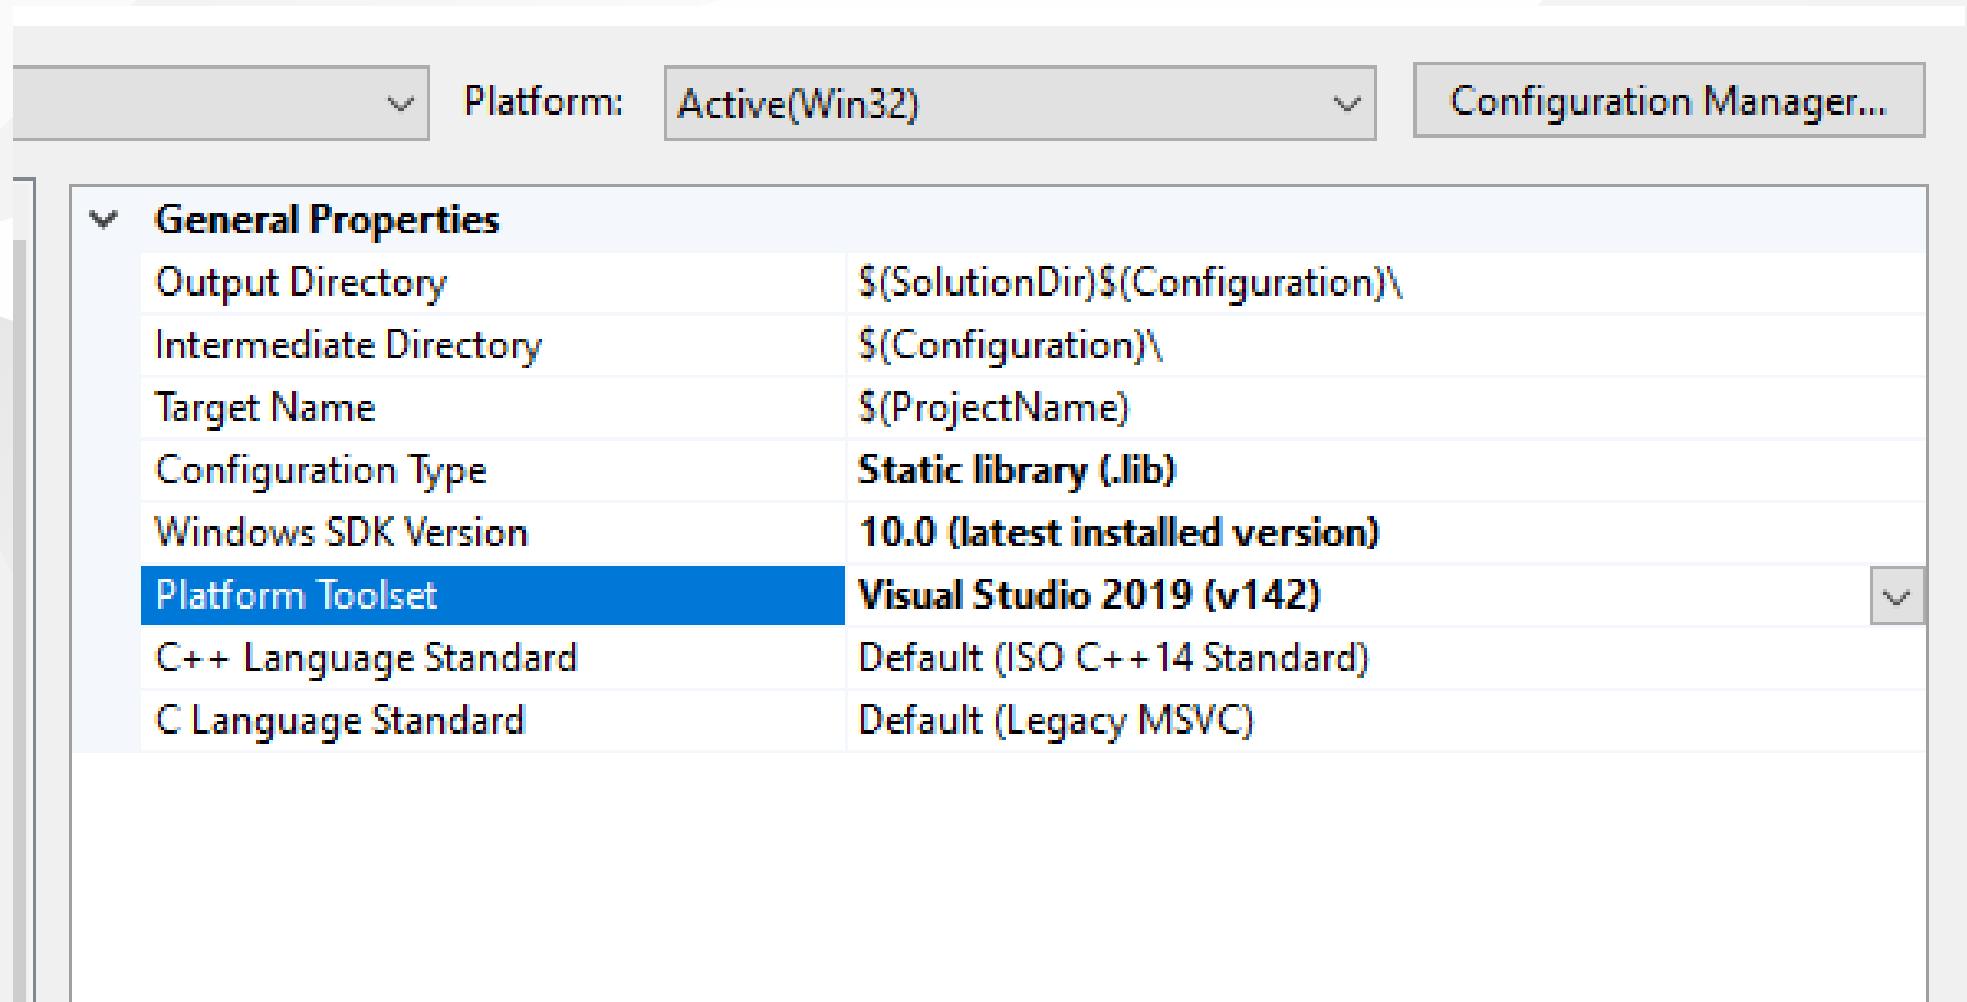

Insert your functions inside the c-sample-lib.c and update header files also.

```
// c-sample-lib.cpp : Defines the functions for the static library.  
  
//  
  
#include "samplelib.h"  
#include "stdio.h"  
  
/// <summary>  
///  
/// </summary>  
/// <param name="name"></param>  
void sayHelloTo(char* name){  
  
    if (name != NULL){  
        printf("Hello %s \n",name);  
    }  
    else {  
        printf("Hello There\n");  
    }  
}  
  
/// <summary>  
///  
/// </summary>  
/// <param name="a"></param>  
/// <param name="b"></param>  
/// <returns></returns>  
int sum(int a, int b){  
  
    int c = 0;  
    c = a + b;  
    return c;  
}
```

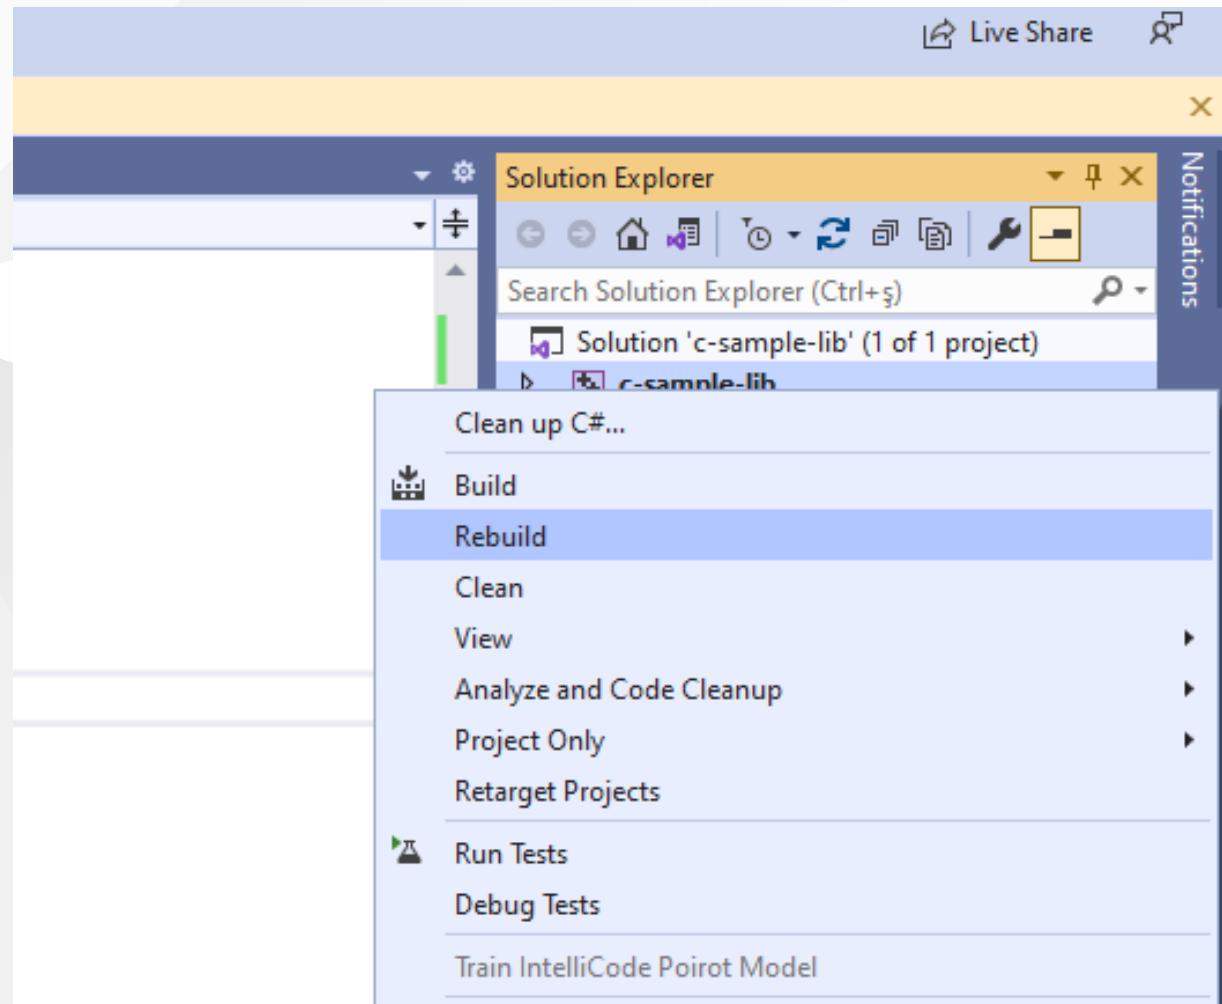

also update samplelib.h

```
#pragma once  
  
#define WIN32_LEAN_AND_MEAN // Exclude rarely-used stuff from Windows headers  
  
void sayHelloTo(char* name);  
int sum(int a, int b);
```

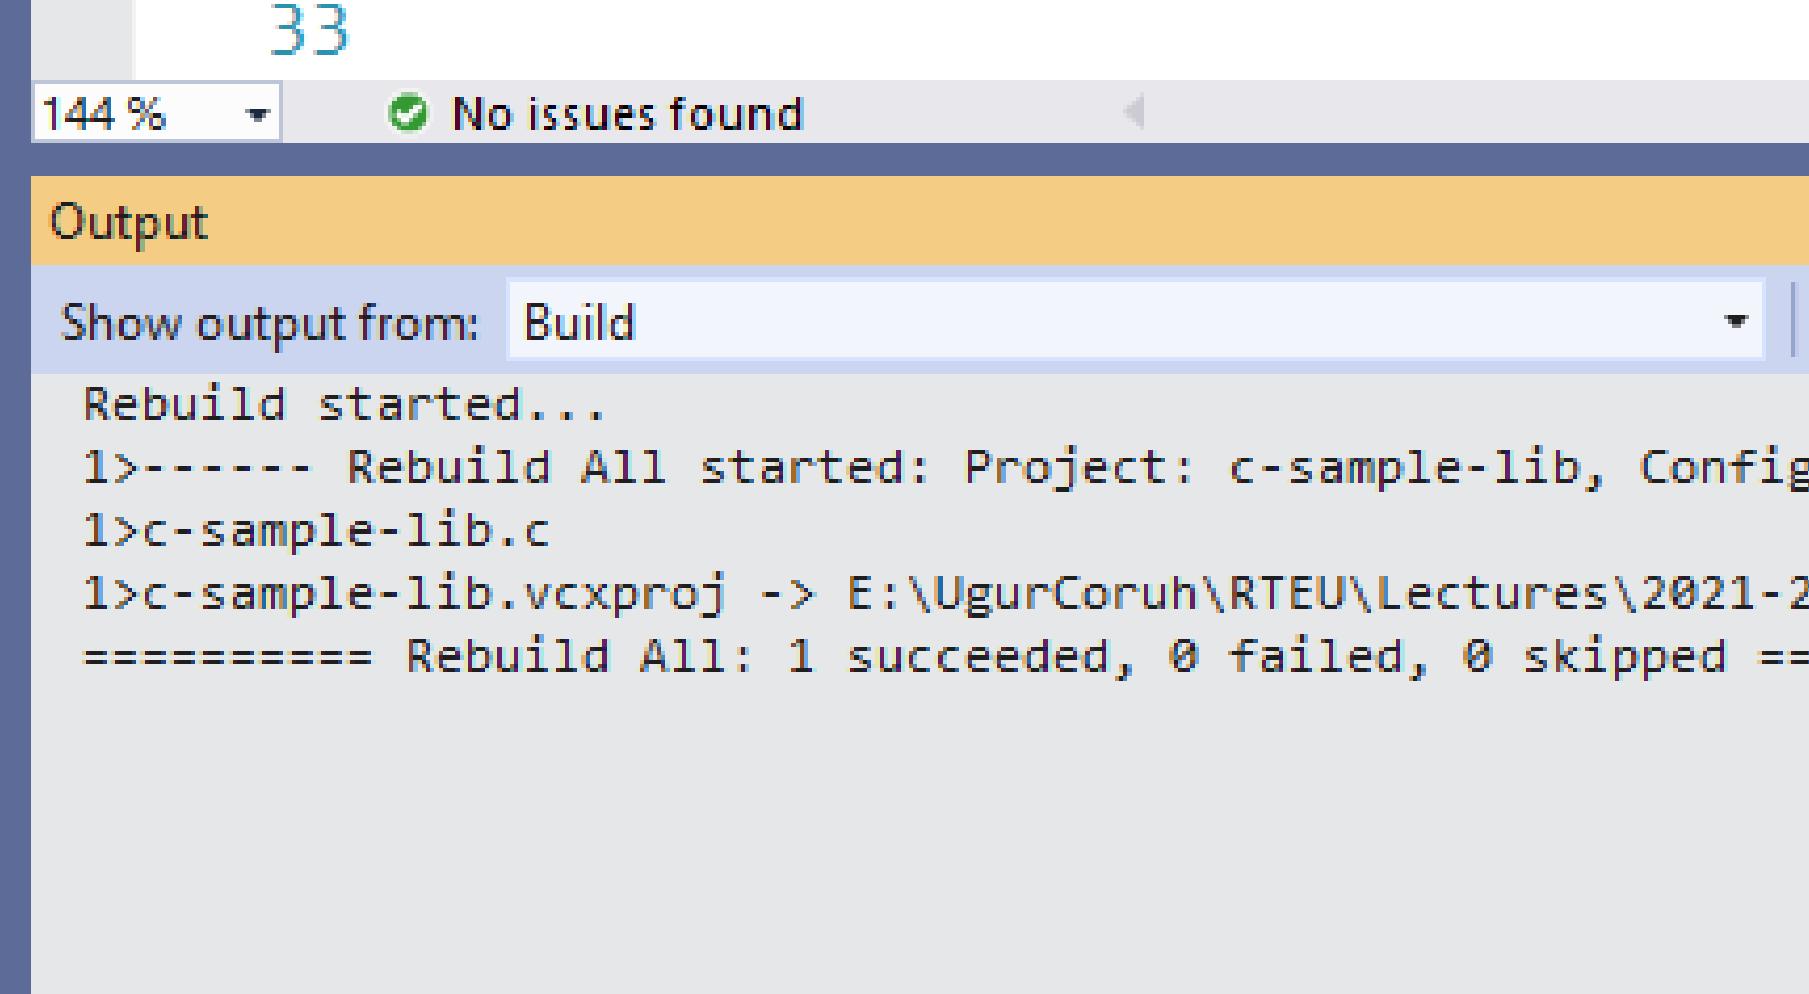

If you check configuration you will see that for C complier we are using Microsoft Environment and Toolkits

Now we can compile our library

You can follow operation from output window

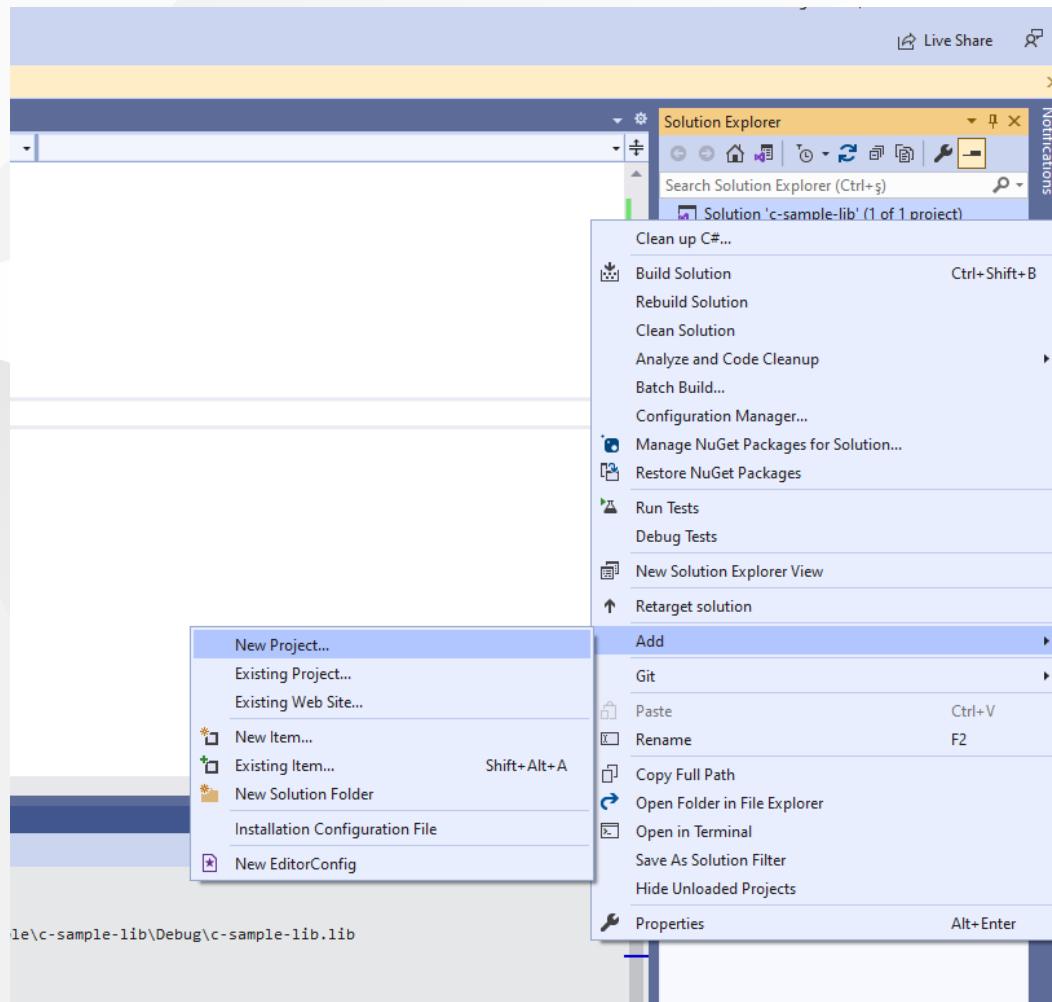

The screenshot shows the Visual Studio Output window. At the top, there is a status bar with the number '33' and a zoom level of '144 %'. A green checkmark icon and the text 'No issues found' are also present. Below the status bar, the title 'Output' is displayed in a yellow header bar. Underneath, a dropdown menu shows 'Show output from: Build'. The main content area of the window displays the following text:

```
Rebuild started...
1>----- Rebuild All started: Project: c-sample-lib, Configuration: Debug
1>c-sample-lib.c
1>c-sample-lib.vcxproj -> E:\UgurCoruh\RTEU\Lectures\2021-2
===== Rebuild All: 1 succeeded, 0 failed, 0 skipped ==
```

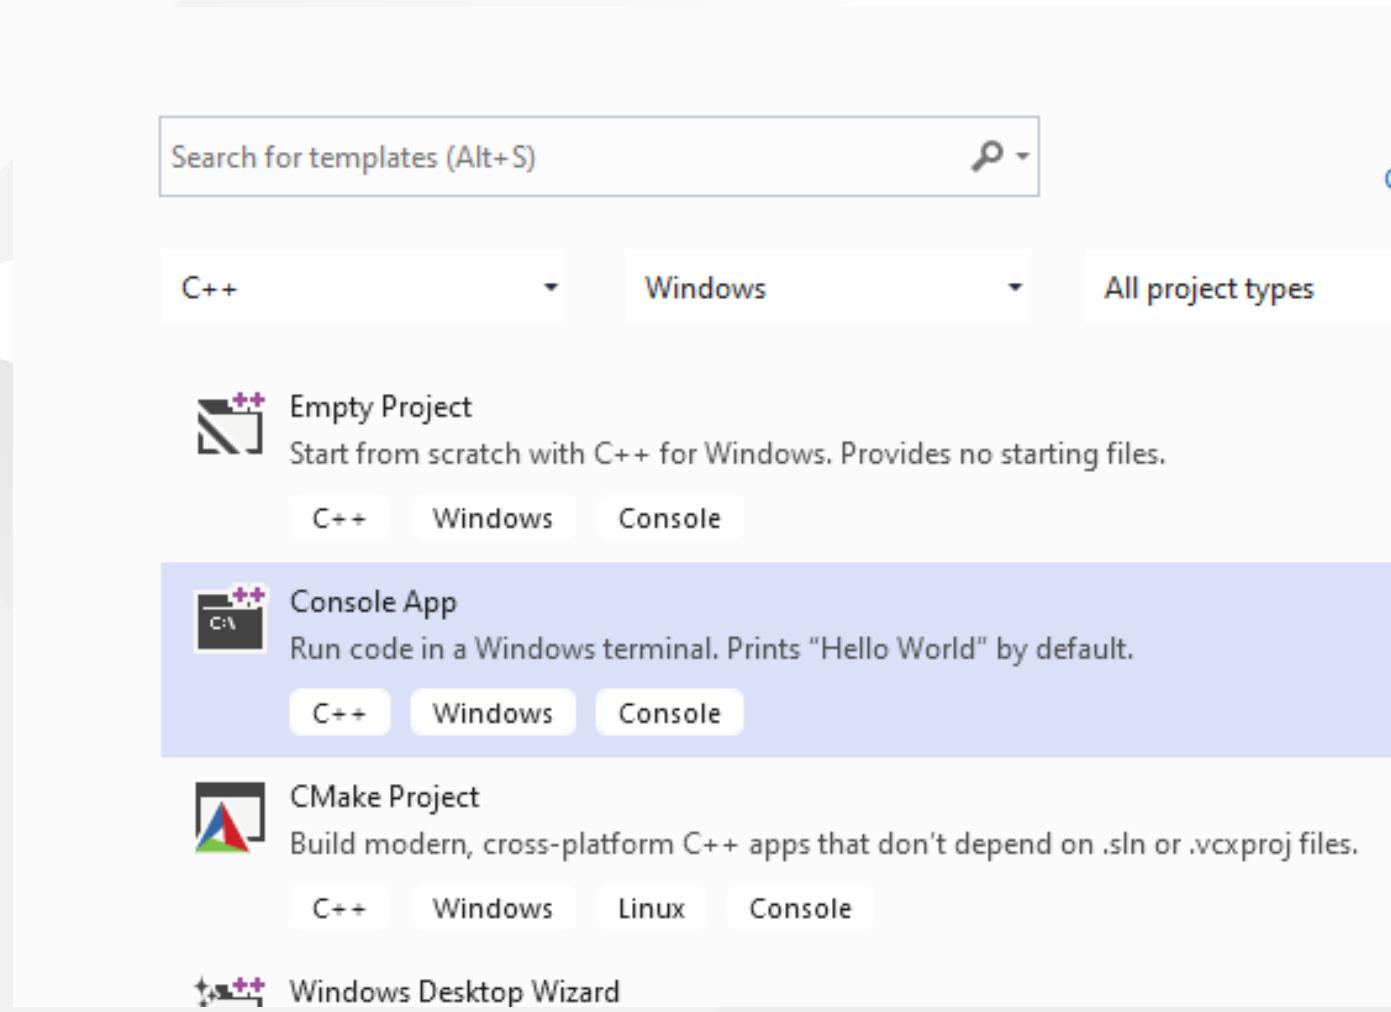

in debug folder we will see our output

Name
 <b>c-sample-lib.idb</b>
 <b>c-sample-lib.lib</b>
 <b>c-sample-lib.pdb</b>

now we will add a console application c-sample-app and use our library

## select C++ Windows Console Application from list

C++ Console Application Selection will generate a C++ console project we can change extension to C to compile our application as C application.

we will convert c-sample-app.c to following code

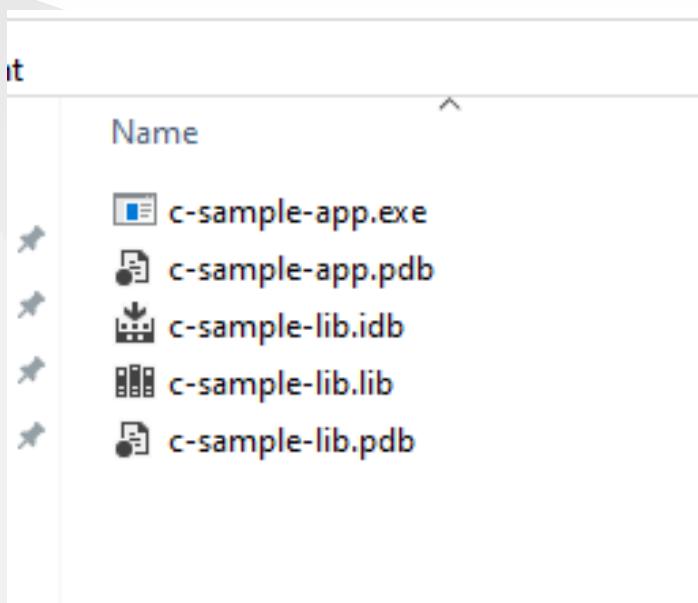

```
#include <stdio.h>

/// <summary>
///
/// </summary>
/// <returns></returns>
int main()
{
    printf("Hello World!\n");
}
```

## after conversion set c-sample-app as startup project and build it

this will create c-sample-app.exe in the same folder with c-sample-lib.lib library

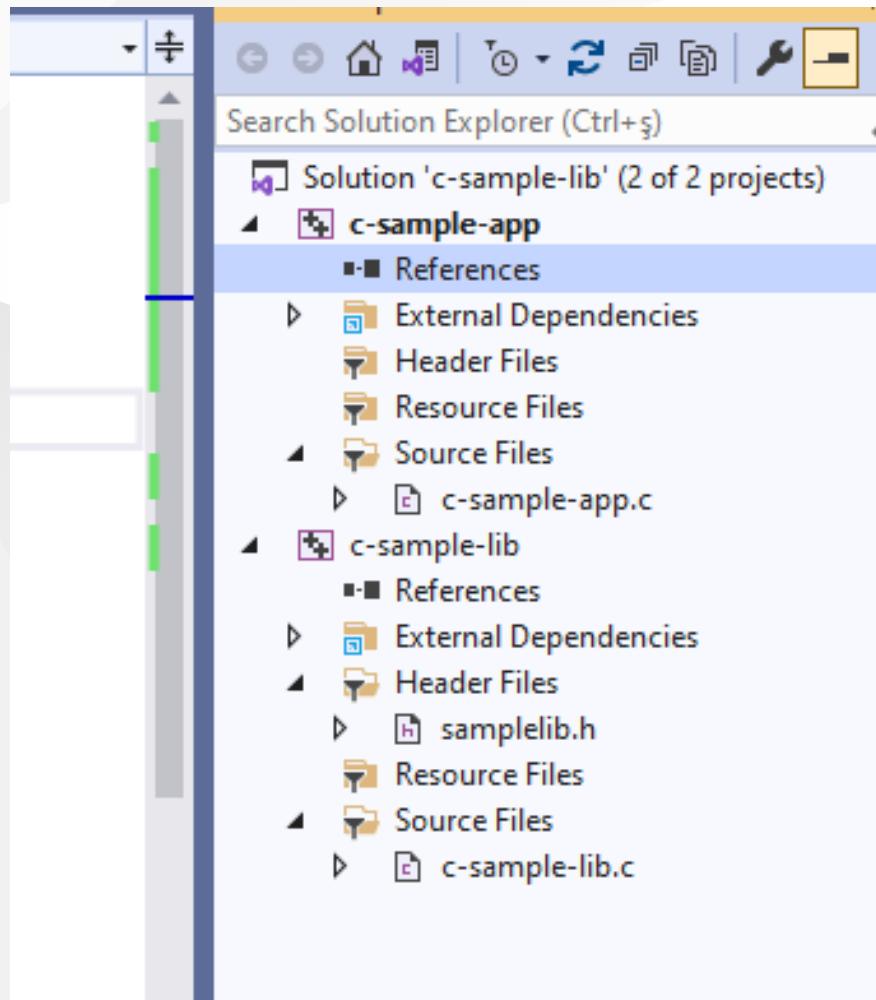

if we run application we will see only "Hello World"

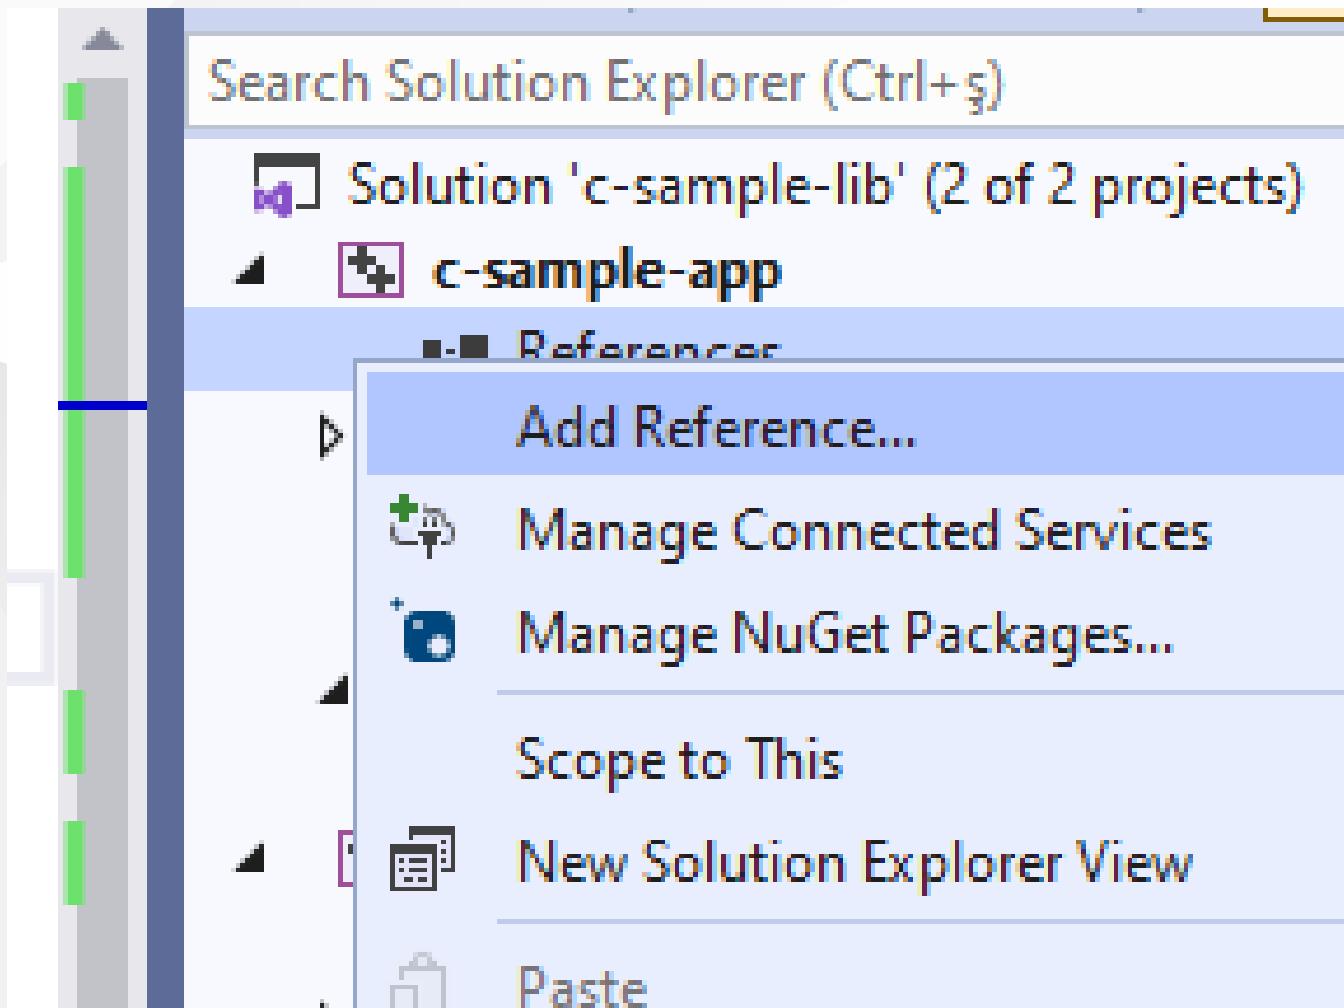

now we will see two options to add library as references in our application and use its functions.

## First option

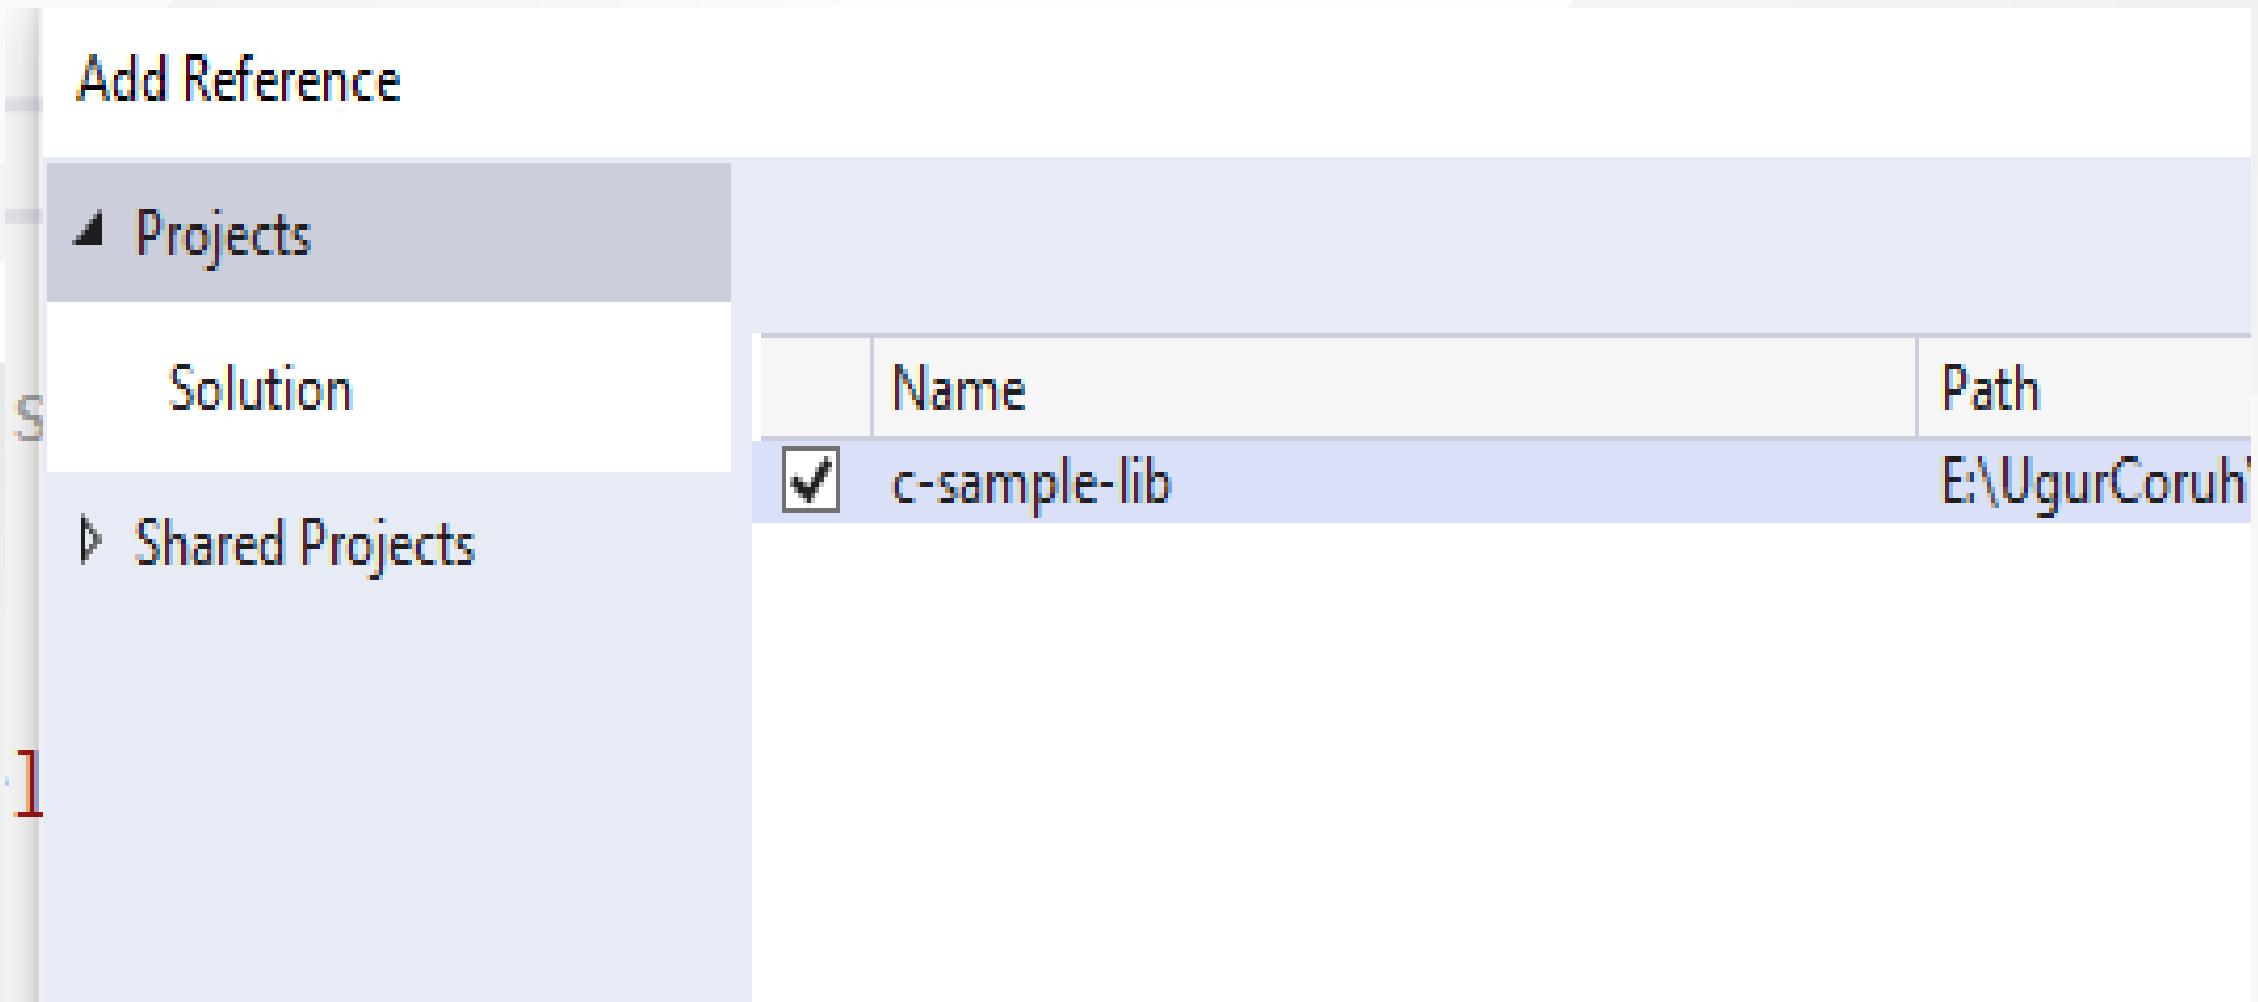

right click references for c-sample-app and add current library as reference

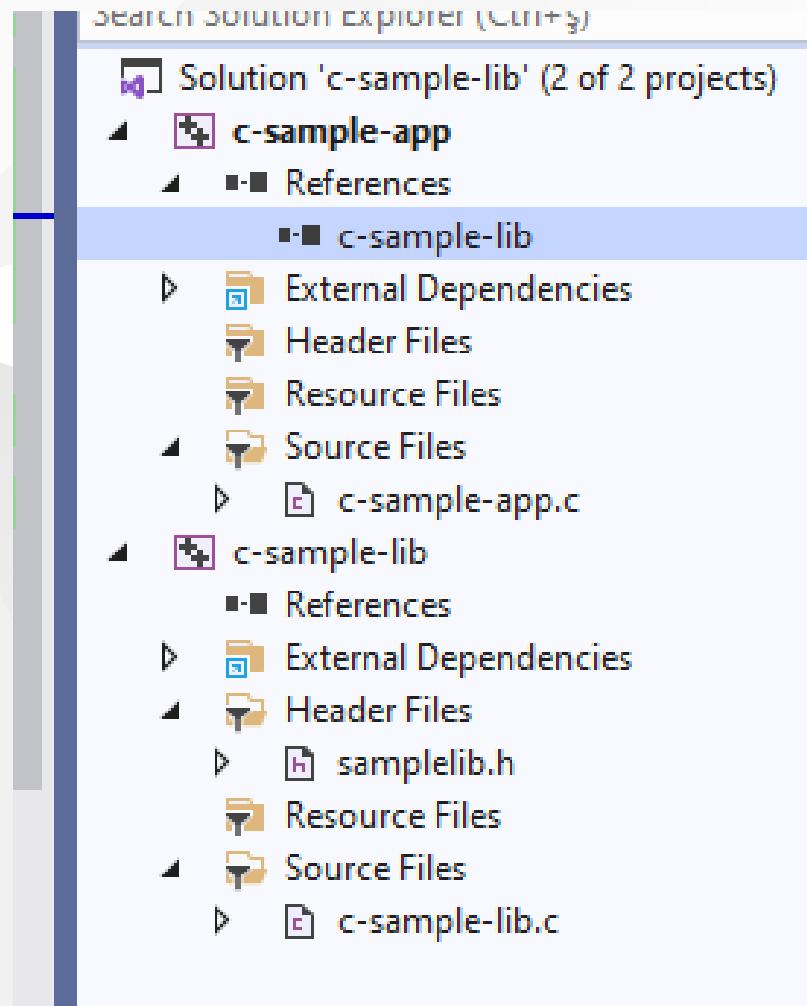

## Select Add Reference

Browse for solution and select c-sample-lib

You can check added reference from references section

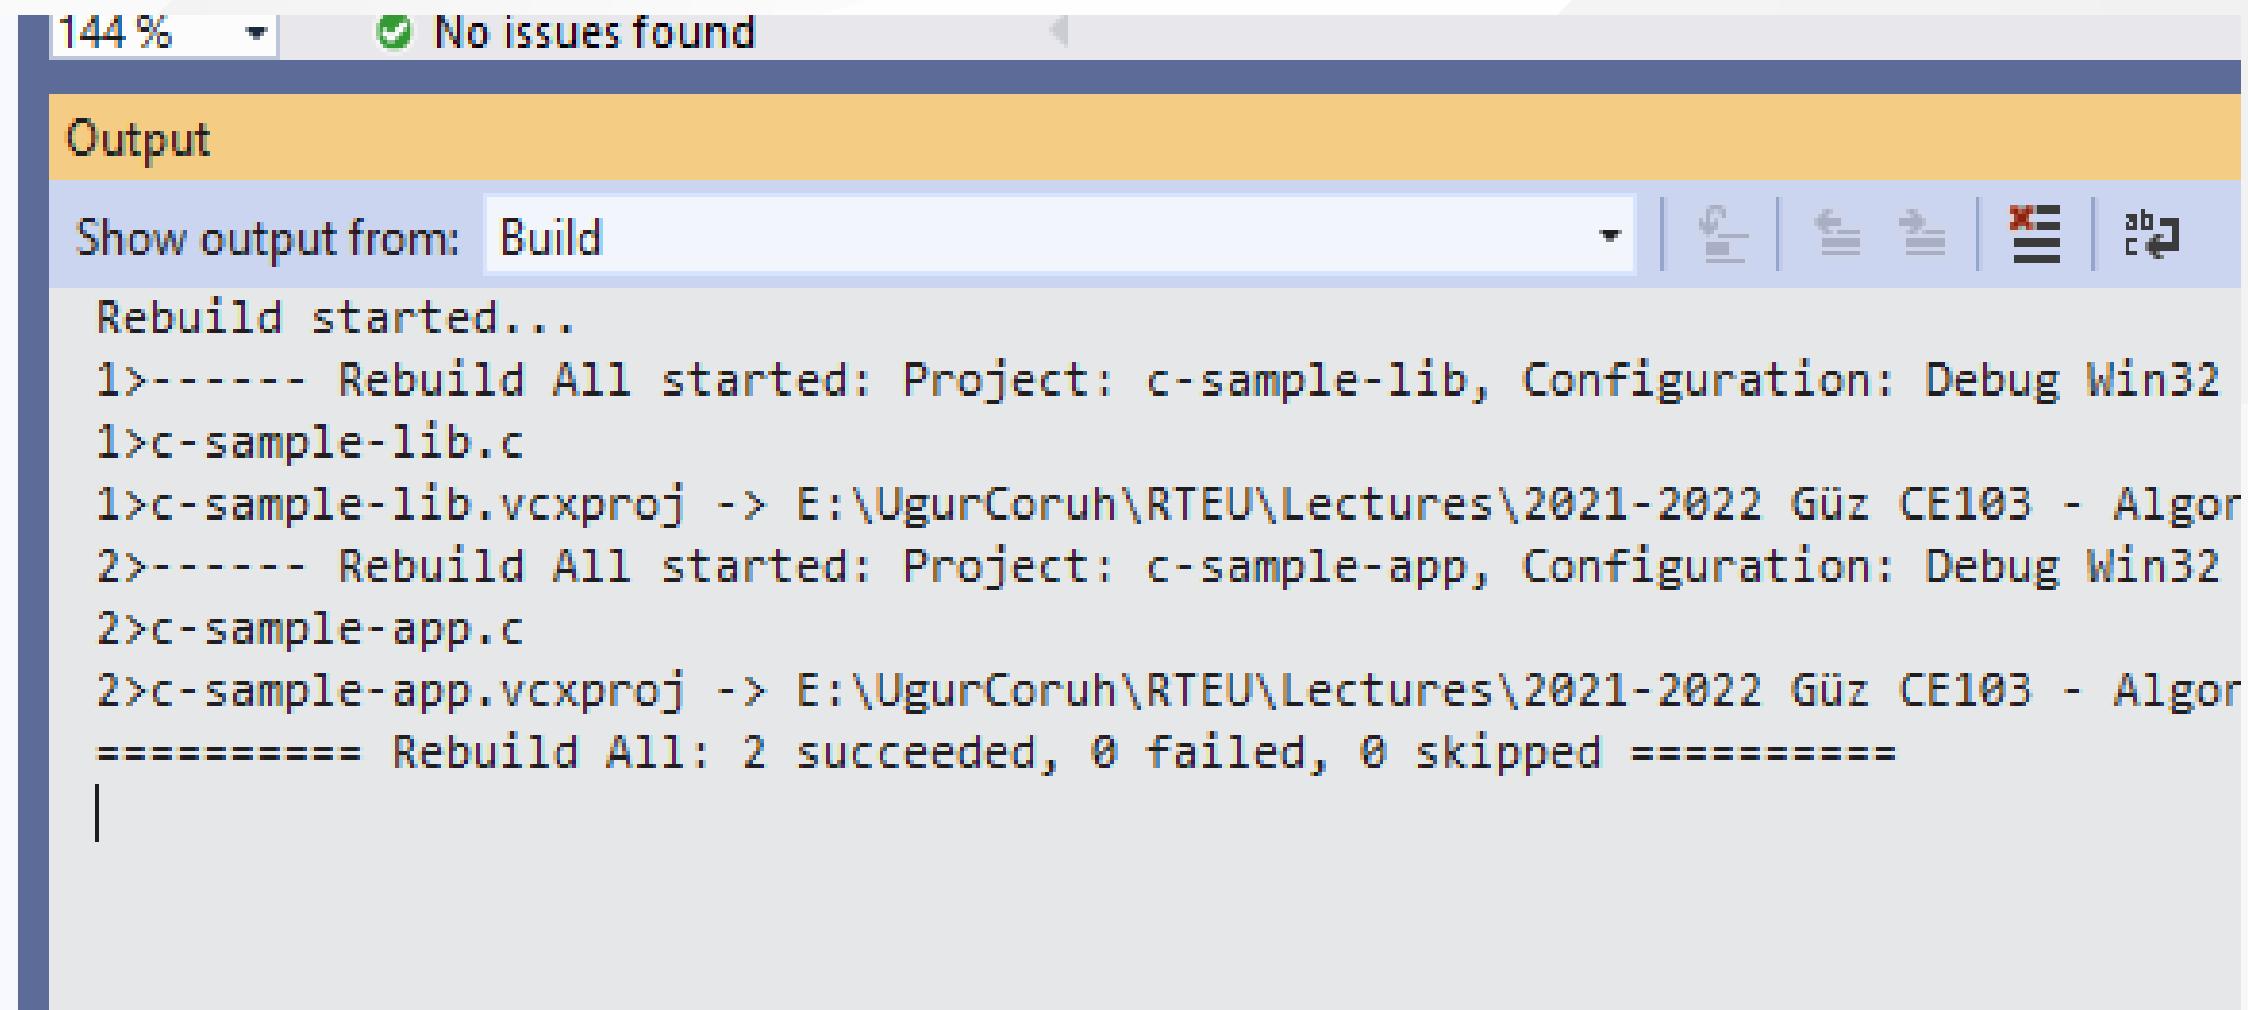

now we can include required headers from c-sample-lib folder and use it.

we can include required header with relative path as follow or with configuration

```
#include <stdio.h>
#include "..\c-sample-lib\samplelib.h"
/// <summary>
///
/// </summary>
/// <returns></returns>
int main()
{
    printf("Hello World!\n");
}
```

we can build our c-sample-app

The screenshot shows the Visual Studio Output window with the following details:

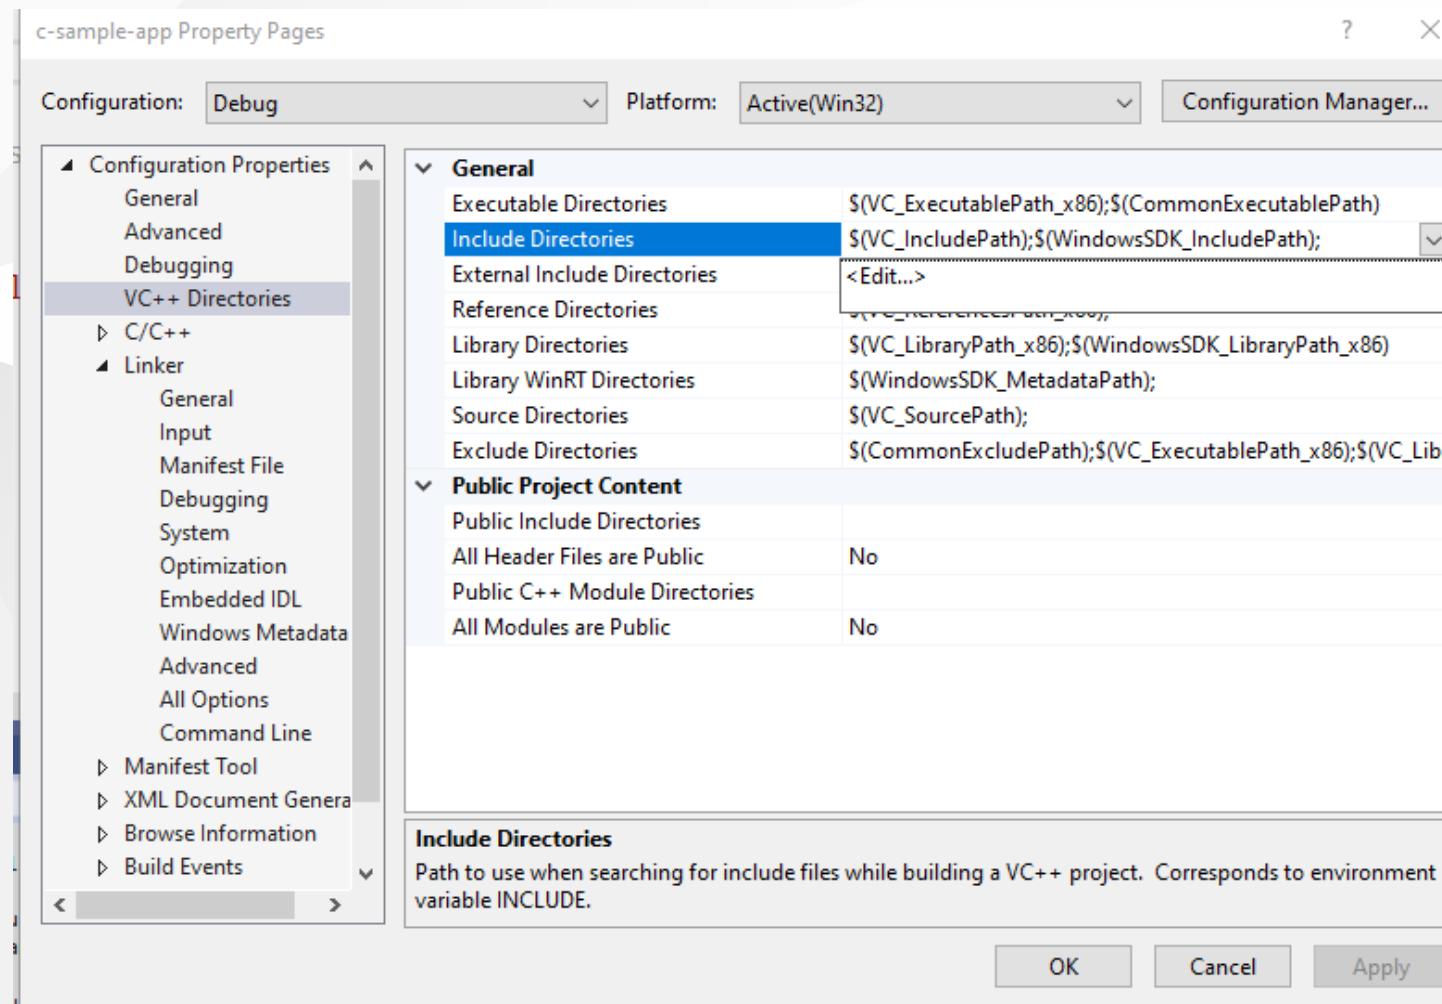

- Top status bar: 144 %, No issues found.
- Section title: Output
- Show output from: Build
- Content:
  - Rebuild started...
  - 1>----- Rebuild All started: Project: c-sample-lib, Configuration: Debug Win32
  - 1>c-sample-lib.c
  - 1>c-sample-lib.vcxproj -> E:\UgurCoruh\RTEU\Lectures\2021-2022 Güz CE103 - Algor
  - 2>----- Rebuild All started: Project: c-sample-app, Configuration: Debug Win32
  - 2>c-sample-app.c
  - 2>c-sample-app.vcxproj -> E:\UgurCoruh\RTEU\Lectures\2021-2022 Güz CE103 - Algor
  - ===== Rebuild All: 2 succeeded, 0 failed, 0 skipped =====

also we can only write header name

```
#include <samplelib.h>
```

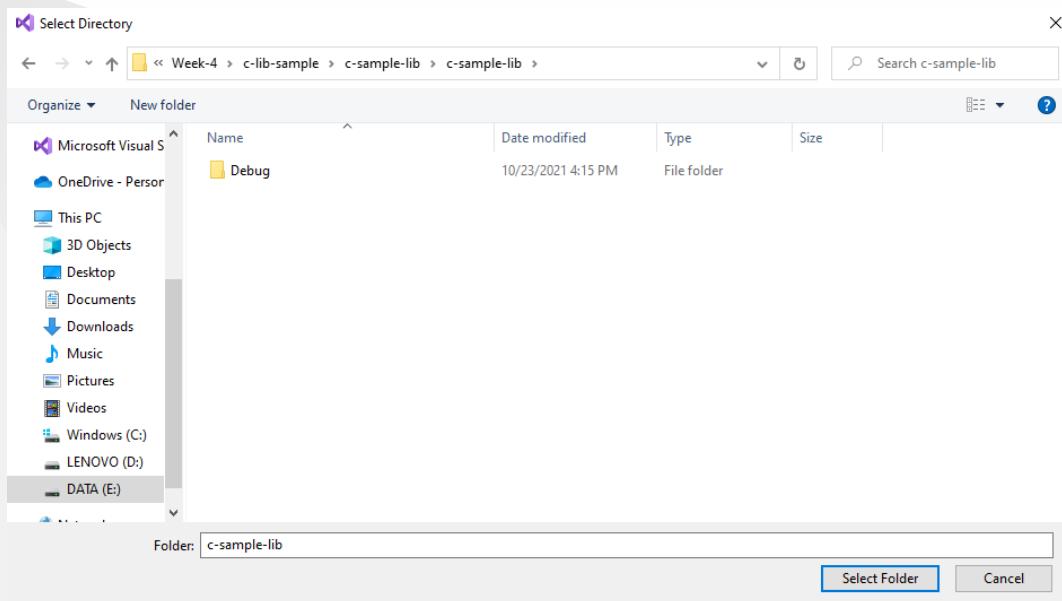

for this we need to configure include directories

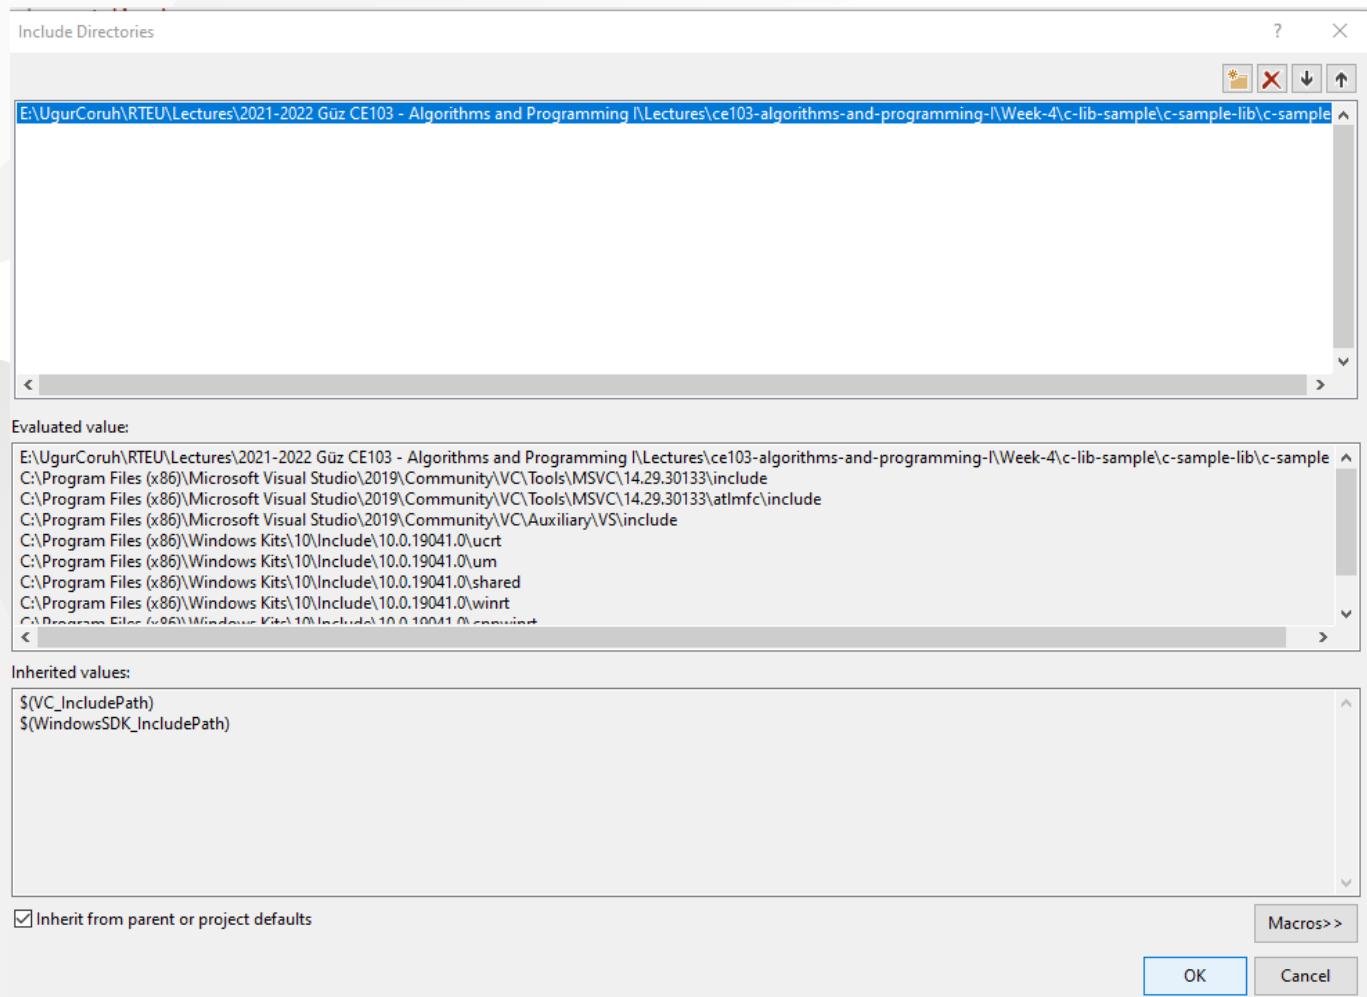

## select c-sample-lib header file location

## browse for folder

your full path will be added to your configuration

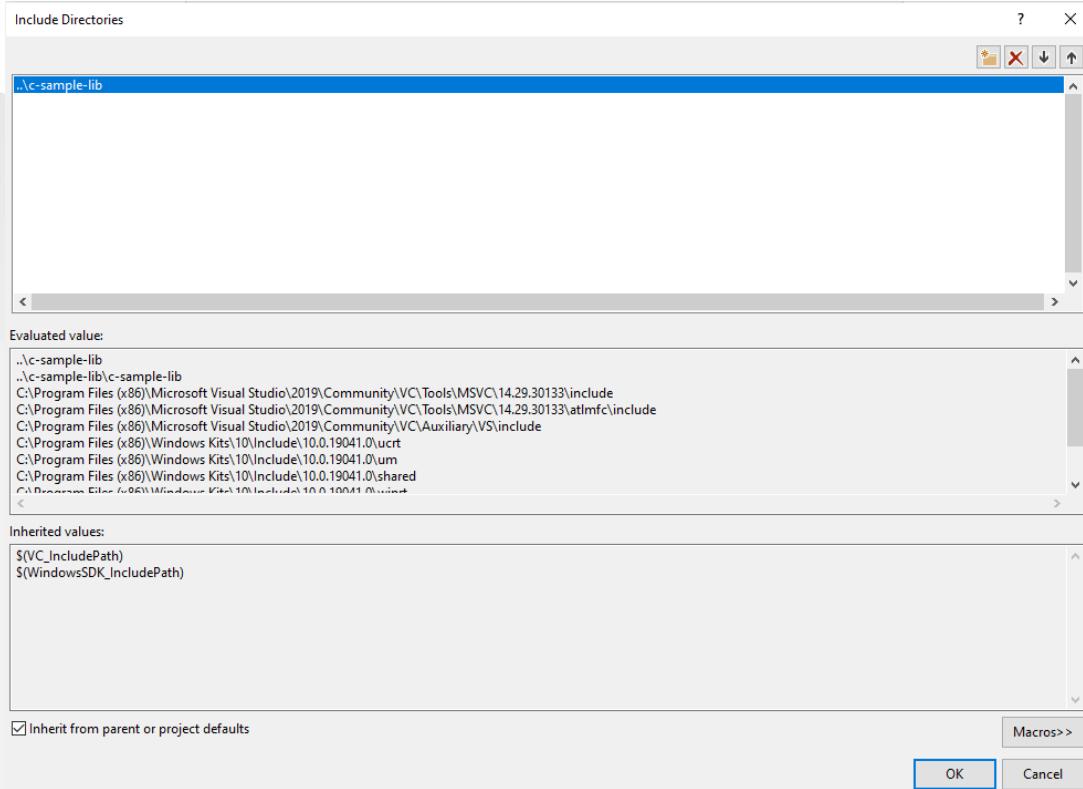

if you add header file paths to your configuration you can use header files by name in your source code

```
#include <stdio.h>
#include <samplelib.h>
/// <summary>
///
/// </summary>
/// <returns></returns>
int main()
{
    printf("Hello World!\n");
}
```

we can compile the following we don't have problems but here we need to configure relative paths for configuration open include library settings and update with relative path

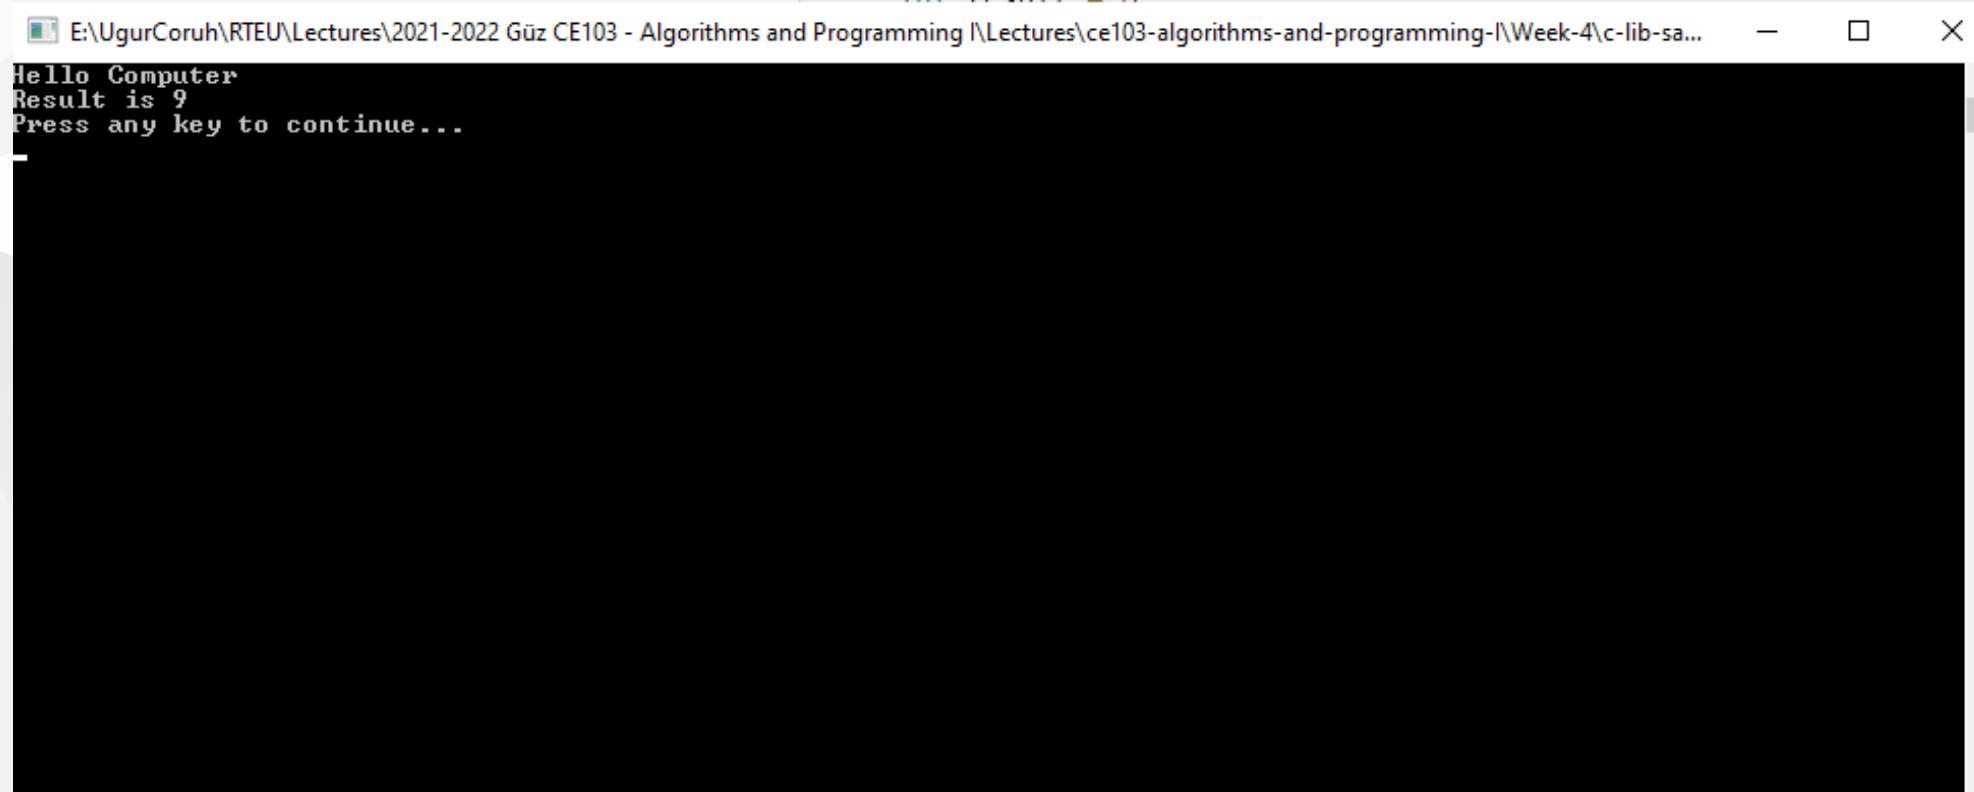

.. \c-sample-lib

now we have portable source code configuration. we can call our functions and then we can update header and library folder configurations.

```
#include <stdio.h>
#include <samplelib.h>
/// <summary>
///
/// </summary>
/// <returns></returns>
int main()
{
    int result = 0;
    //printf("Hello World!\n");
    result = sum(5, 4);
    sayHelloTo("Computer");
    printf("Result is %d \n",result);
    printf("Press any key to continue...\n");
    getchar();
    return 0;
}
```

when you run you will see the following outputs, that mean we called library functions.

A screenshot of a terminal window titled "E:\UgurCoruh\RTEU\Lectures\2021-2022 Güz CE103 - Algorithms and Programming \Lectures\ce103-algorithms-and-programming-\Week-4\c-lib-sa...". The window contains the following text:  
Hello Computer  
Result is 9  
Press any key to continue...

static library is a code sharing approach if you want to share your source code with your customers then you can share static libraries and header files together. Another case you can use a precompiled static library with you or this library can be part of any installation then if there is a installed app and static libraries are placed on system folder or any different location then you can use configuration files to set library path and included header paths

Now we can remove project from c-sample-app references but we will set library file in configuration

Before this copy static library and header files to a folder like that

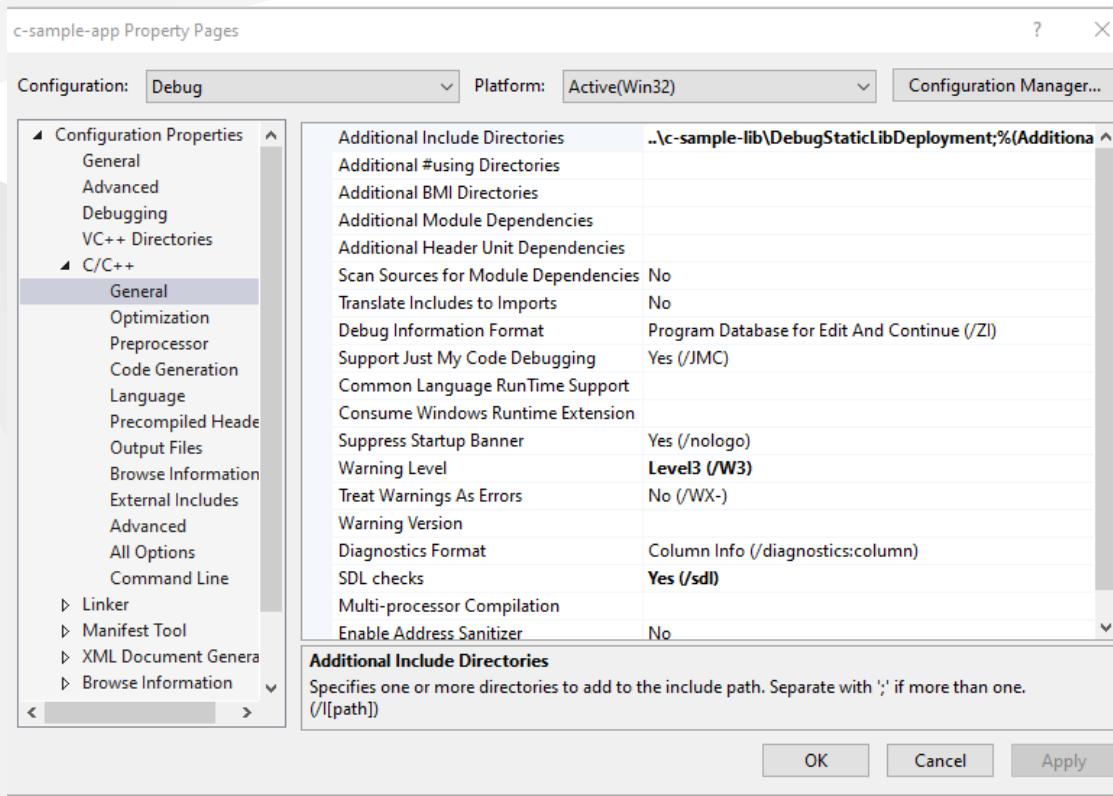

#### DebugStaticLibDeployment

- Set C/C++ -> General -> Additional Include Directories

There is a bug in configurations and relative path not finding headers so for this reason we will set full path but this is not a good practice for team working

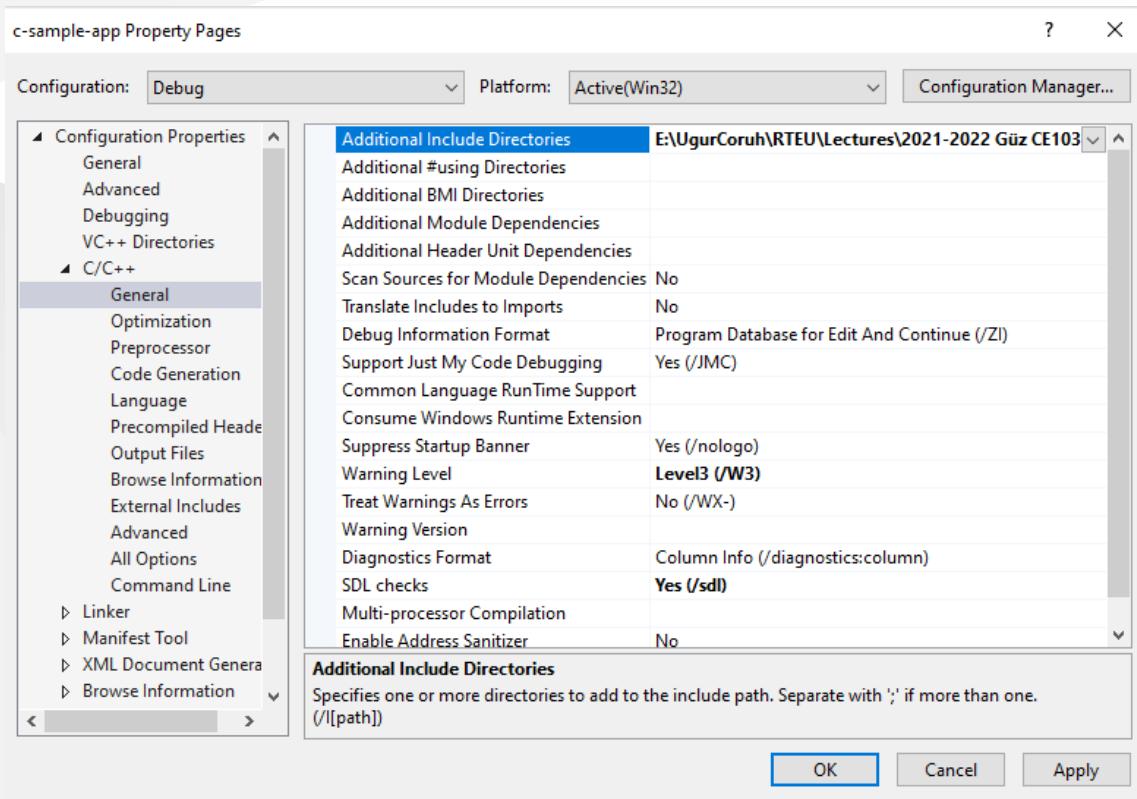

## Not Working

..\\c-sample-lib\\DebugStaticLibDeployment

# Working

E:\....\c-lib-sample\c-sample-lib\DebugStaticLibDeployment

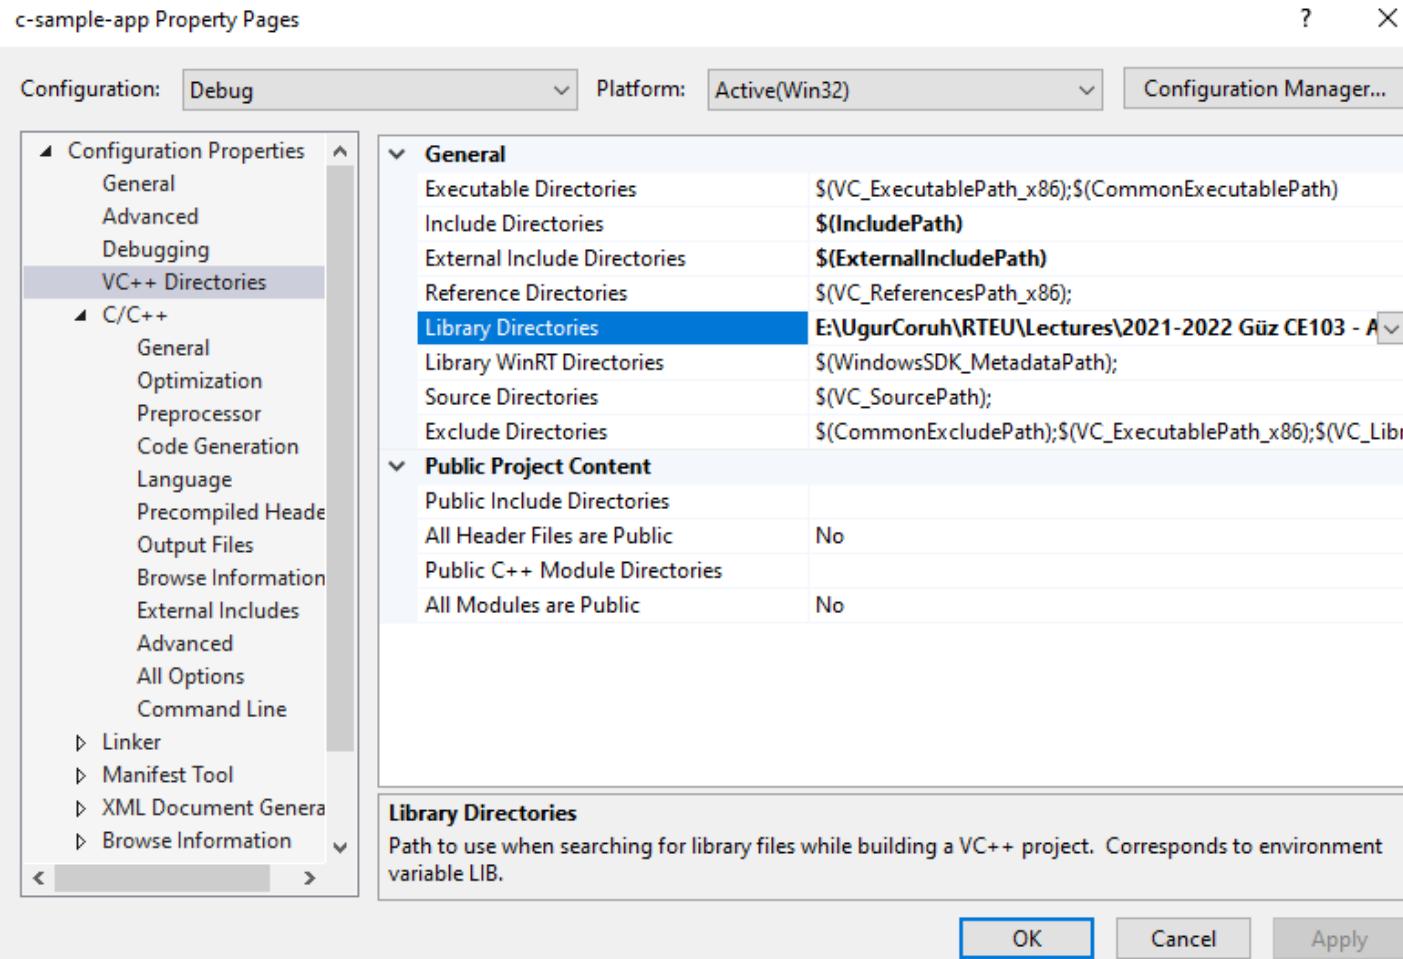

Now we will set library folder that our static library placed

we will set VC++ Directories -> Library Directories

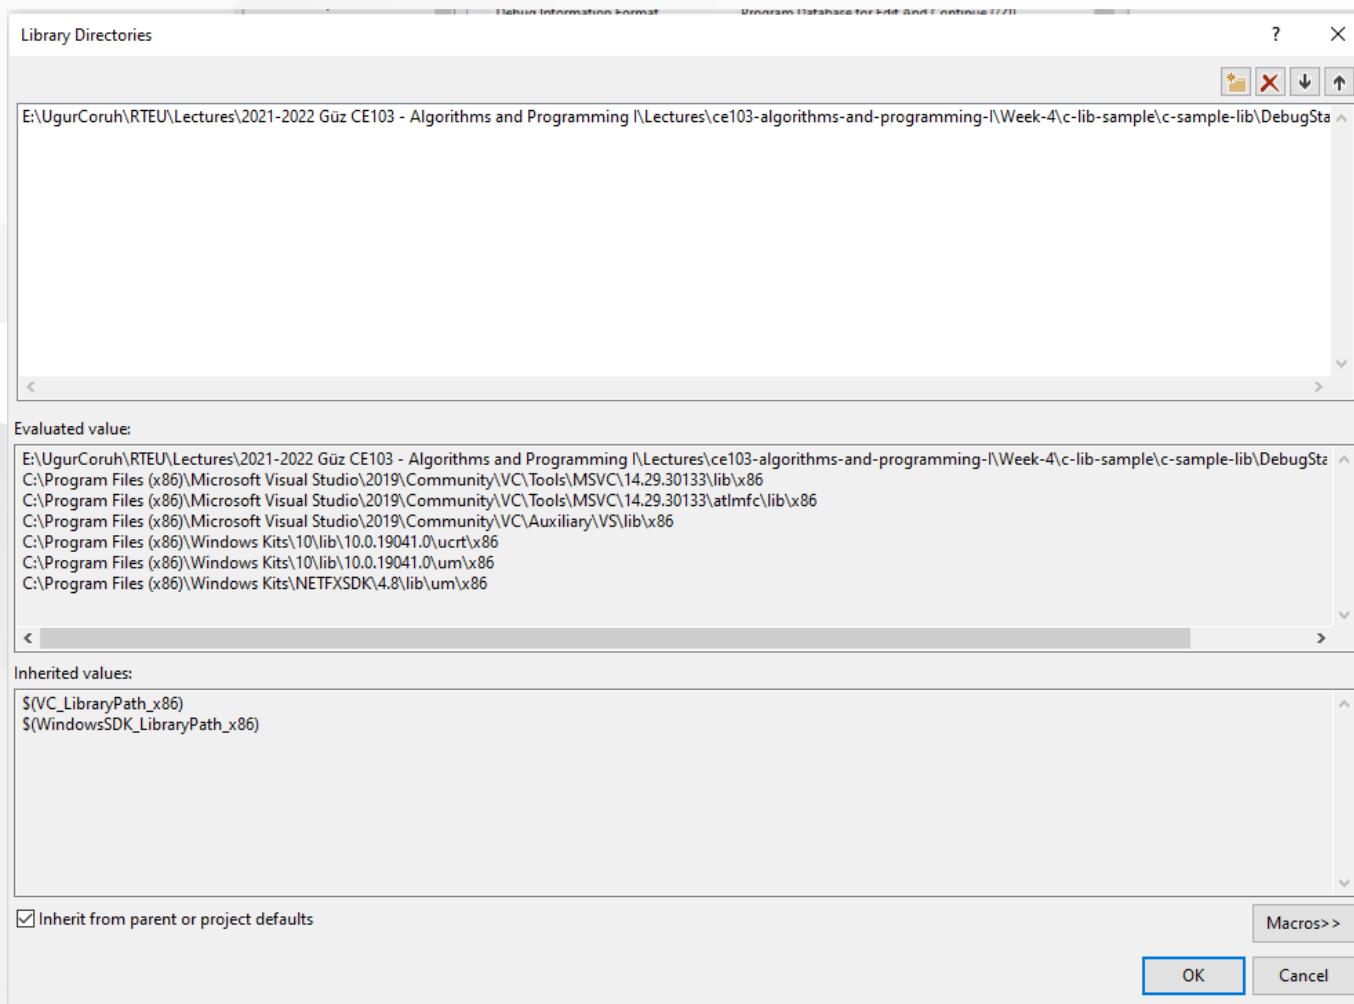

Here is the same issue if we use relative path it doesn't work we need to set full path for library folder

# Working

E:\....\c-lib-sample\c-sample-lib\DebugStaticLibDeployment

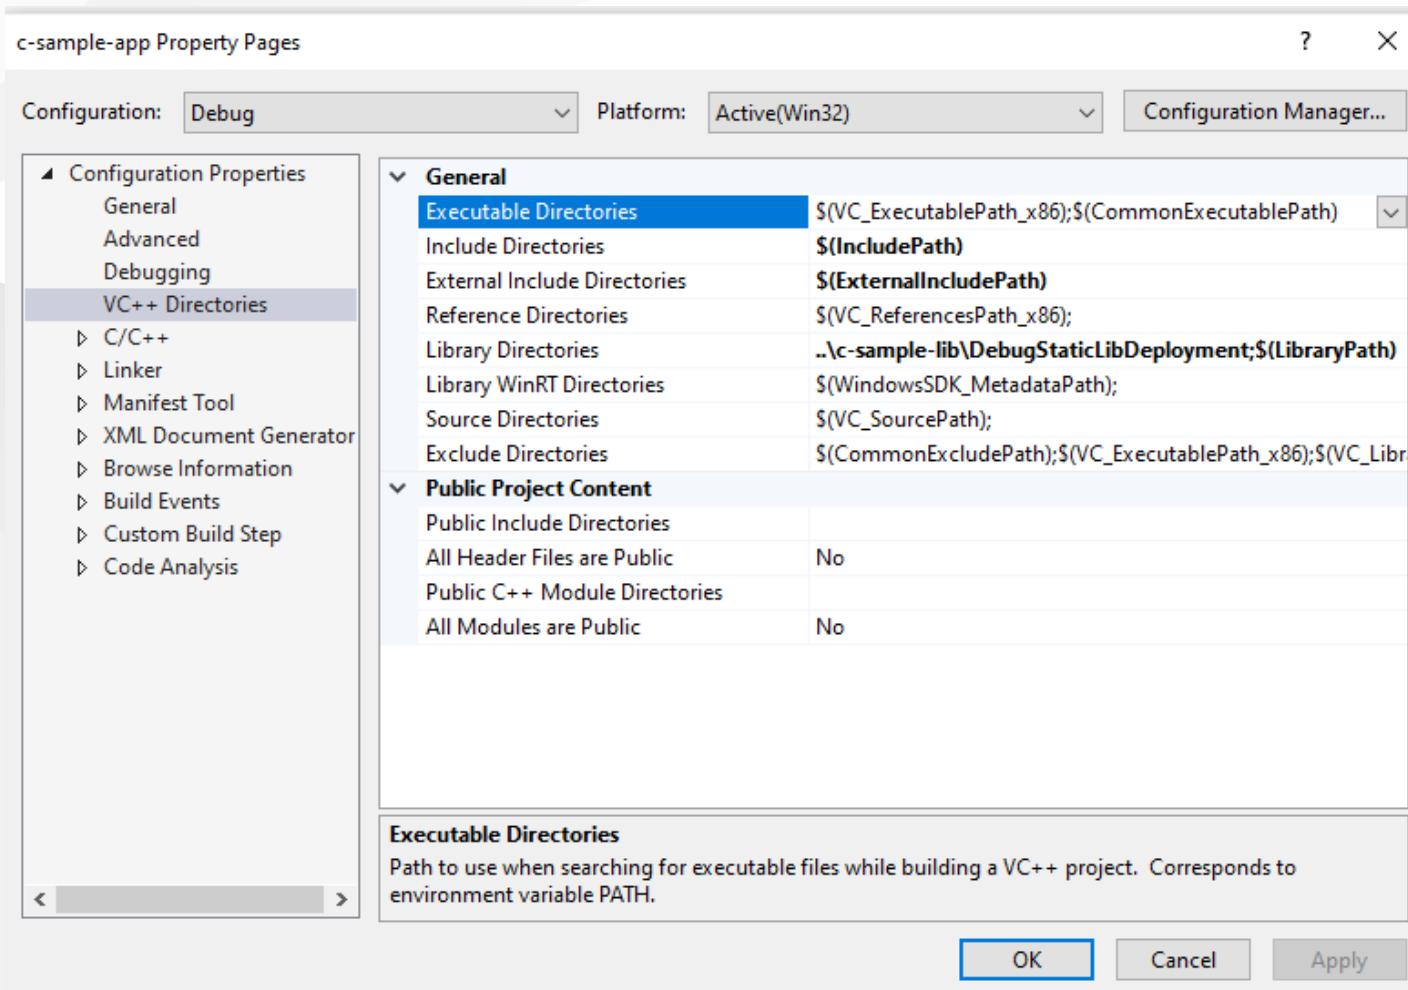

# Introduction to Code Reusability and Automate Testing

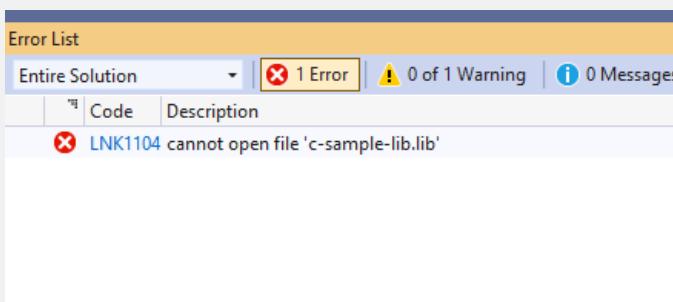

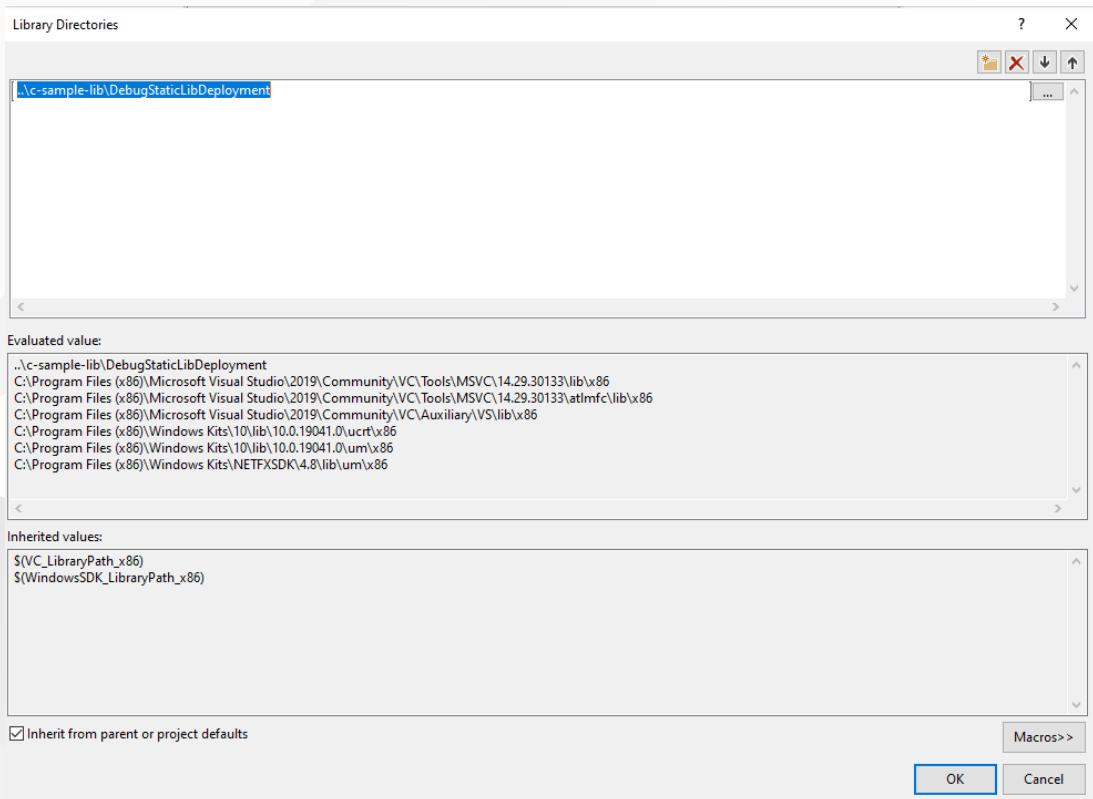

# Not Working

..\c-sample-lib\DebugStaticLibDeployment

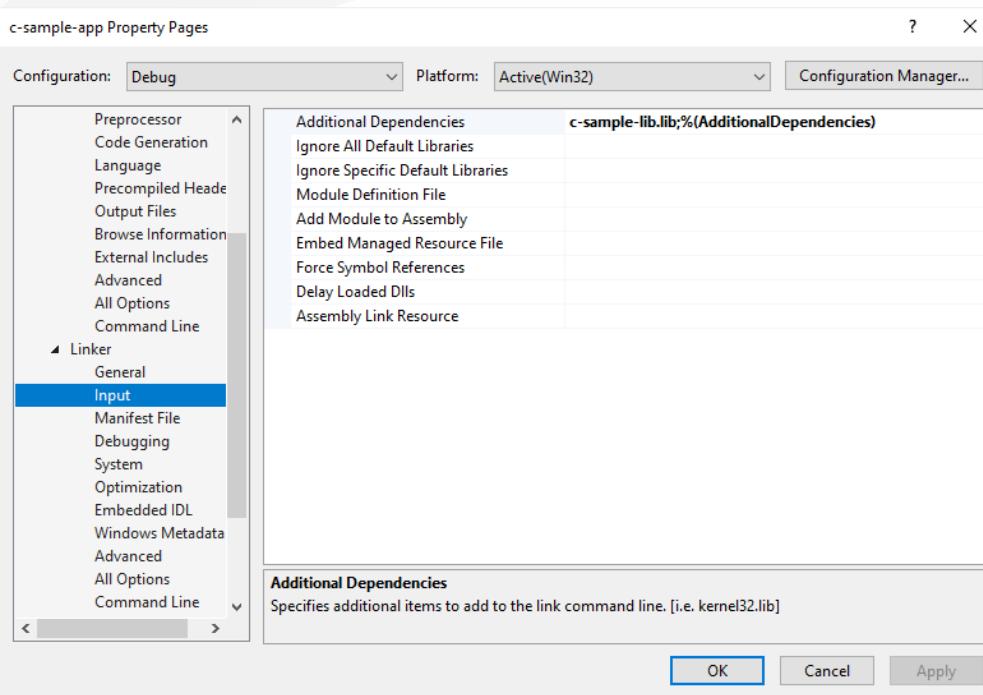

# Introduction to Code Reusability and Automate Testing

If we set full path for both libraries and headers then we need to set library name for project

## Linker->Input->Additional Dependencies

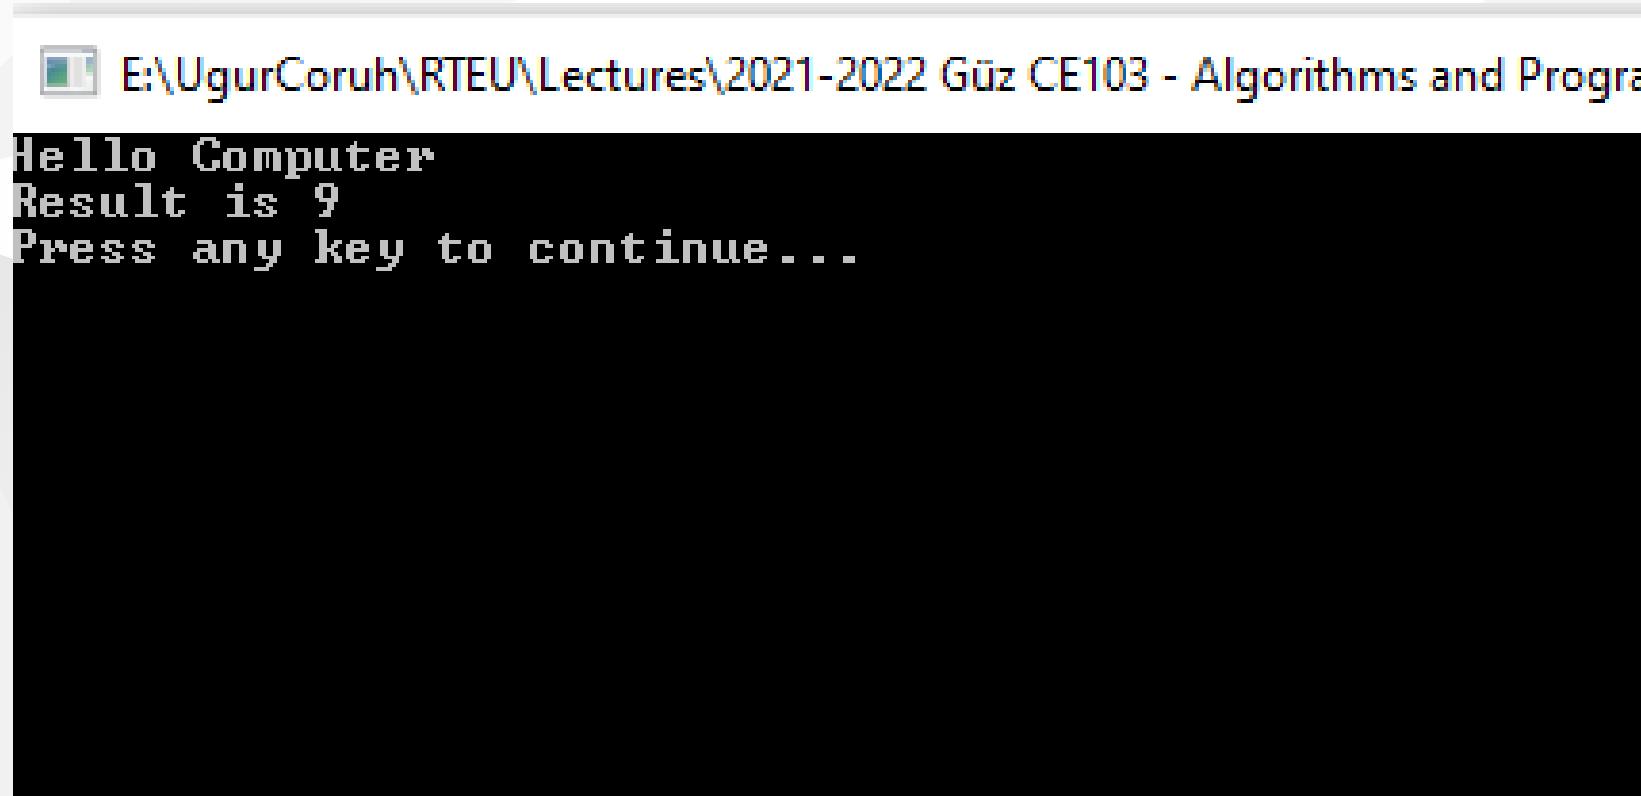

In this case we will compile c-sample-app and we do not need to compile c-sample-lib because we copied output files to different location and they are ready to use.

current source code will be like that nothing changed

```
#include <stdio.h>
#include <samplelib.h>

/// <summary>
///
/// </summary>
/// <returns></returns>
int main()
{
    int result = 0;
    //printf("Hello World!\n");
    result = sum(5, 4);
    sayHelloTo("Computer");
    printf("Result is %d \n",result);
    printf("Press any key to continue...\n");
    getchar();
    return 0;
}
```

and output

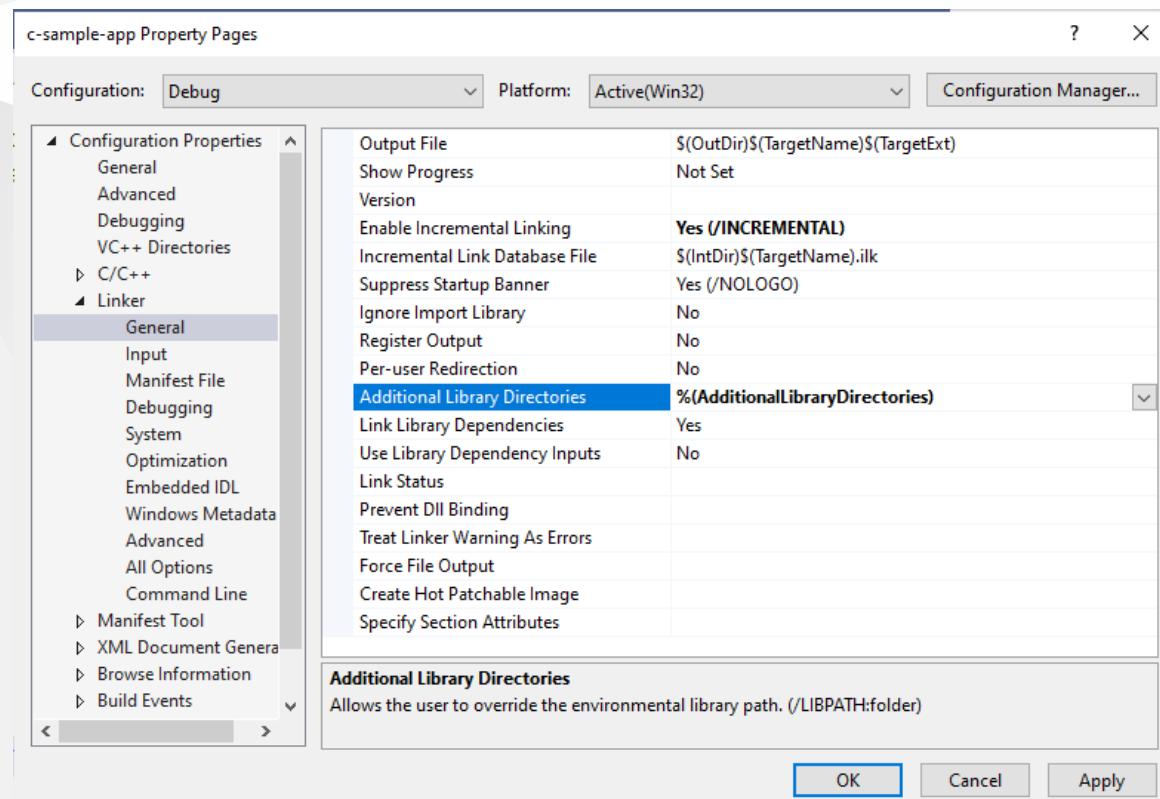

A screenshot of a terminal window with a black background and white text. The window title bar reads "E:\UgurCoruh\RTEUN\Lectures\2021-2022 Güz CE103 - Algorithms and Program". The terminal displays the following text:  
Hello Computer  
Result is 9  
Press any key to continue...

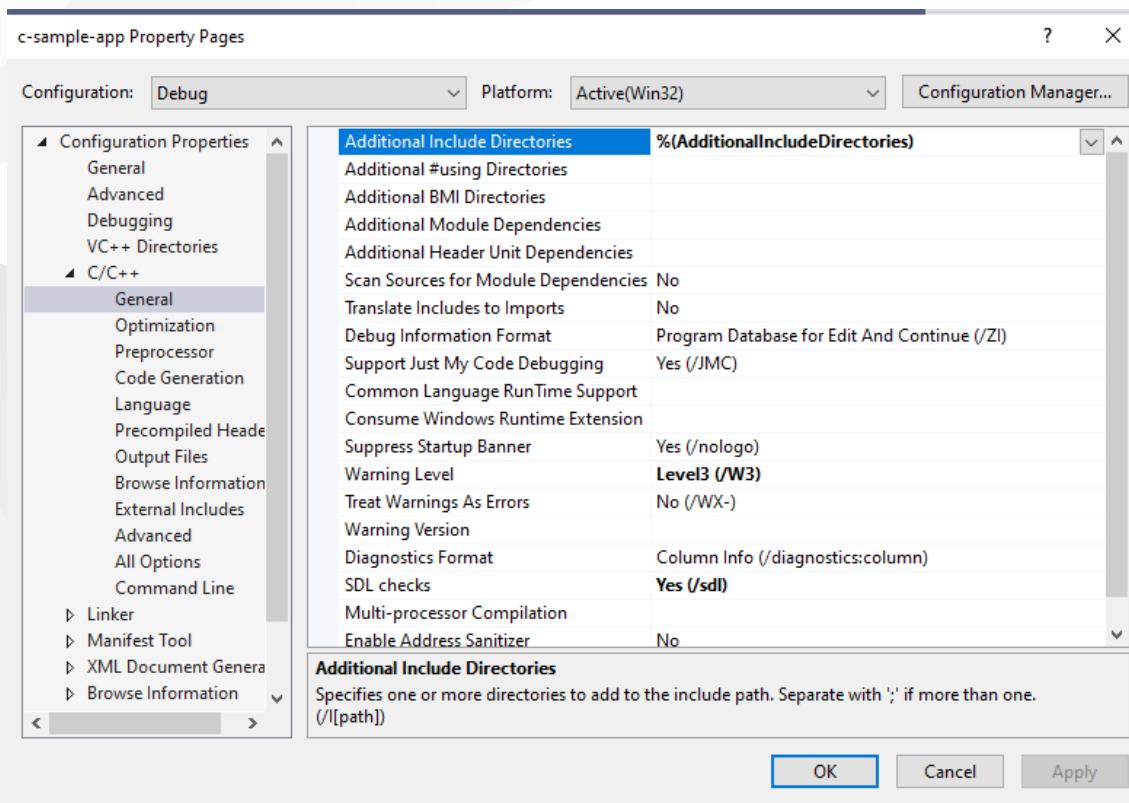

There is a option about portability that we can set for team works

We will remove all library related settings from configurations and we will write them in source code

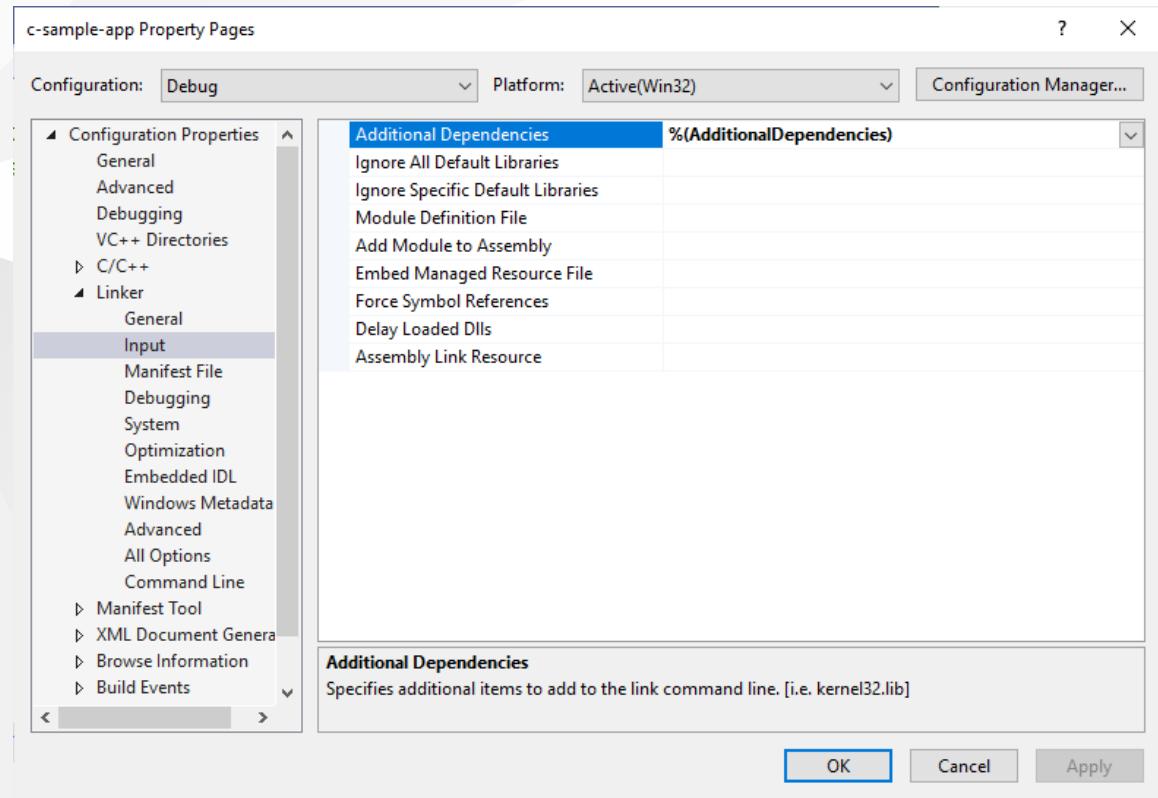

Clear linker->general->additional library directories

## Clear C/C++ -> General -> Additional Include Directories

## Clear Linker->Input->Additional Dependencies

# Now we can set this configurations in source code as follow

Introduction to Code Reusability and Automate Testing

```
#pragma comment(lib, "..\\DebugStaticLibDeployment\\c-sample-lib.lib")
#include "..\\DebugStaticLibDeployment\\samplelib.h"

#include <stdio.h>

/// <summary>
///
/// </summary>
/// <returns></returns>
int main()
{
    int result = 0;
    //printf("Hello World!\n");
    result = sum(5, 4);
    sayHelloTo("Computer");
    printf("Result is %d \n",result);
    printf("Press any key to continue... \n");
    getchar();
    return 0;
}
```

with this configuration if your friends download this code then they can run them with their environment without setting a path.

RTEU CE103 Week-4

## C++ Programming (Static Library)

## Visual Studio Community Edition

All steps are similar with C programming above, but you do not need to delete pch.h

You should take care about compiled source codes

for example if your code is compiled for x86 then your application also should use the x86 configuration else x64 then library should be x64 complied version.

## Source will look like the following

```
// cpp-sample-app.cpp : This file contains the 'main' function. Program execution begins and ends there.  
//  
  
#pragma comment(lib, "...\\DebugStaticLibDeployment\\cpp-sample-lib.lib")  
  
#include "...\\DebugStaticLibDeployment\\samplelib.h"  
  
#include <iostream>  
  
int main()  
{  
    std::cout << "Hello World!\n";  
  
    int result = 0;  
    //printf("Hello World!\n");  
    result = sum(5, 4);  
    sayHelloTo("Computer");  
    printf("Result is %d \n", result);  
    printf("Press any key to continue...\\n");  
    getchar();  
    return 0;  
}
```

## C/C++ WSL Option

## Install WSL

[GitHub - ucoruh/ns3-wsl-win10-setup: ns3 windows 10 WSL2 setup and usage](#)

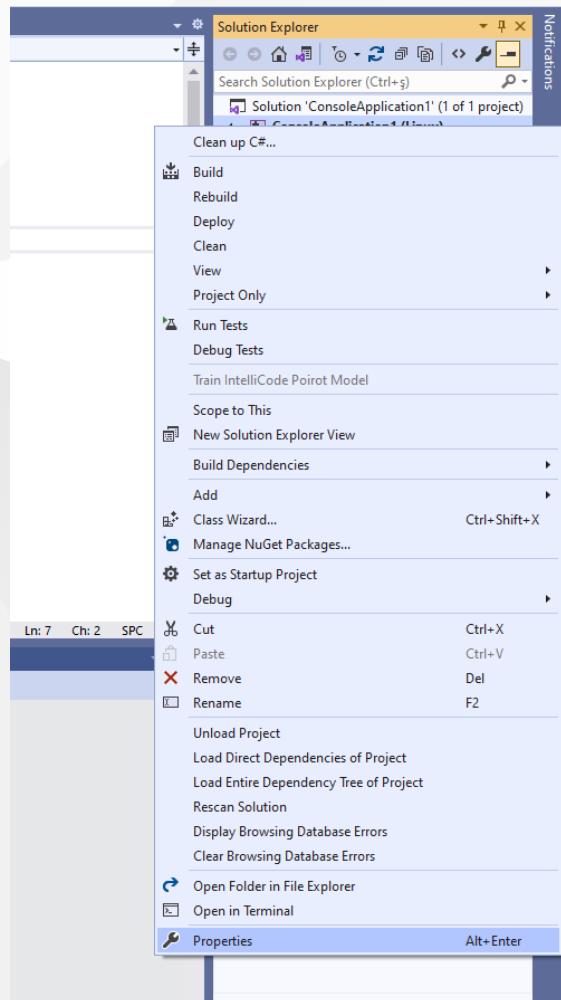

Create a Linux project

The screenshot shows the Microsoft Visual Studio Marketplace interface. At the top, there are three dropdown menus: 'C++' (selected), 'Linux' (selected), and 'All project types'. Below these, there are three main project categories displayed:

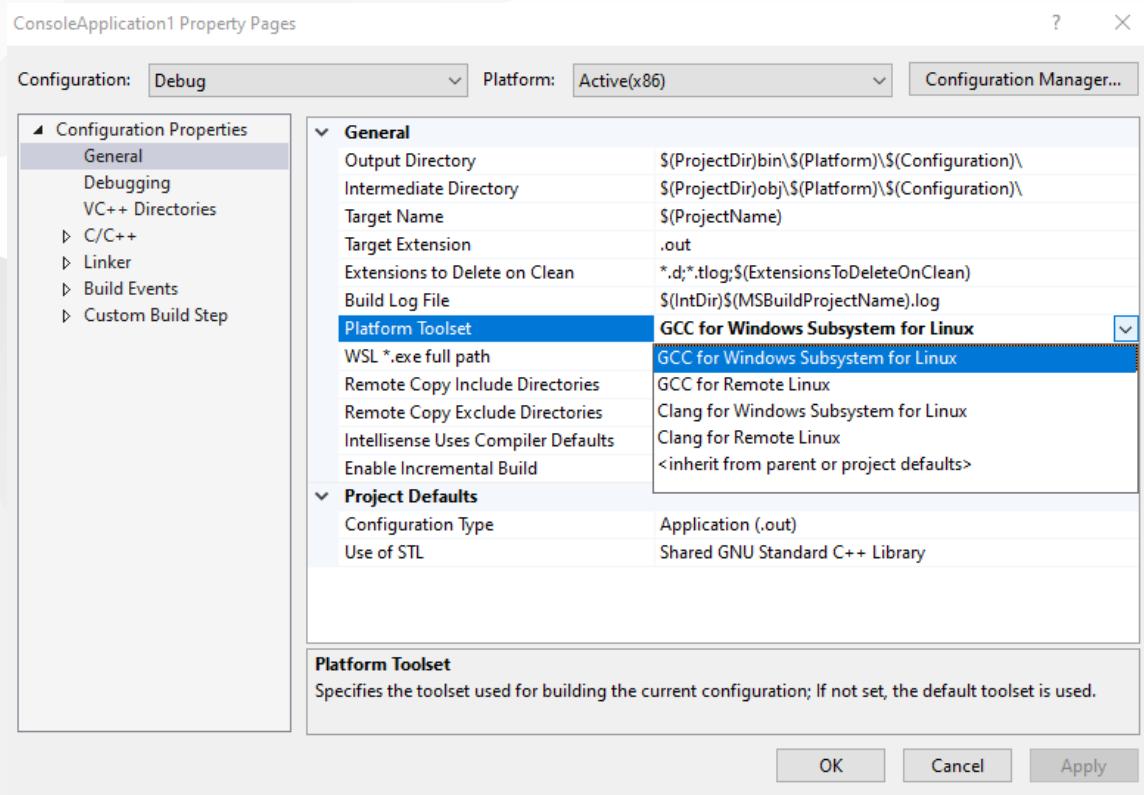

- CMake Project**: Build modern, cross-platform C++ apps that don't depend on .sln or .vcxproj files. It includes tabs for C++, Windows, Linux, and Console.
- Console Application**: Run code in a Linux terminal. Prints "hello" by default. It includes tabs for C++, Linux, and Console.
- Empty Project**: A placeholder project icon.

At the bottom left, there is a logo for RTEU CE103 Week-4.

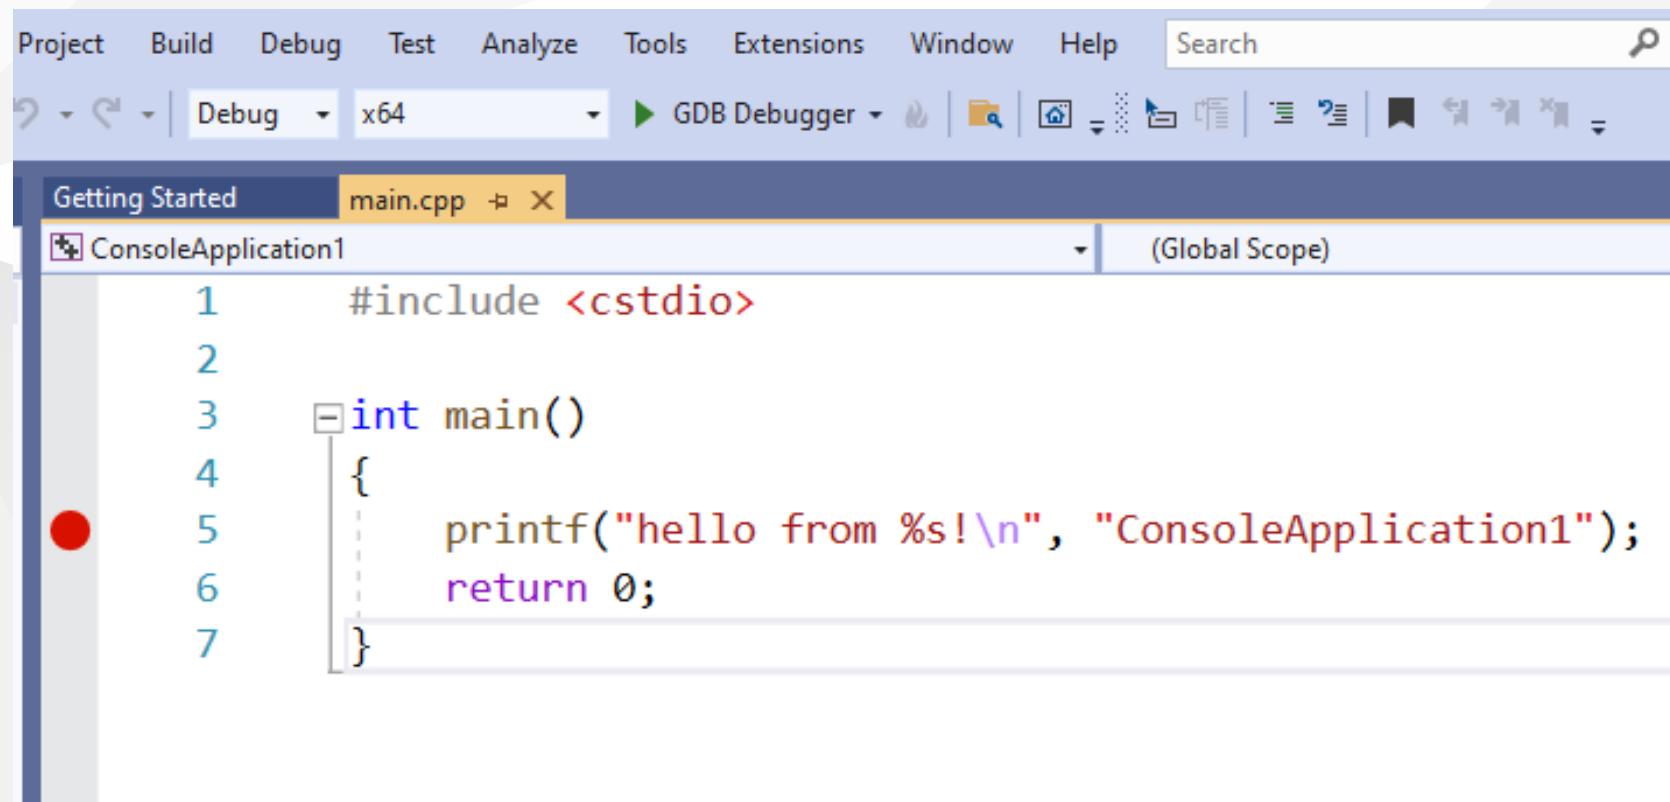

## Configure Platform Toolset to WSL

## Select GCC for Windows Subsystem for Linux

## Put a breakpoint and run debugger

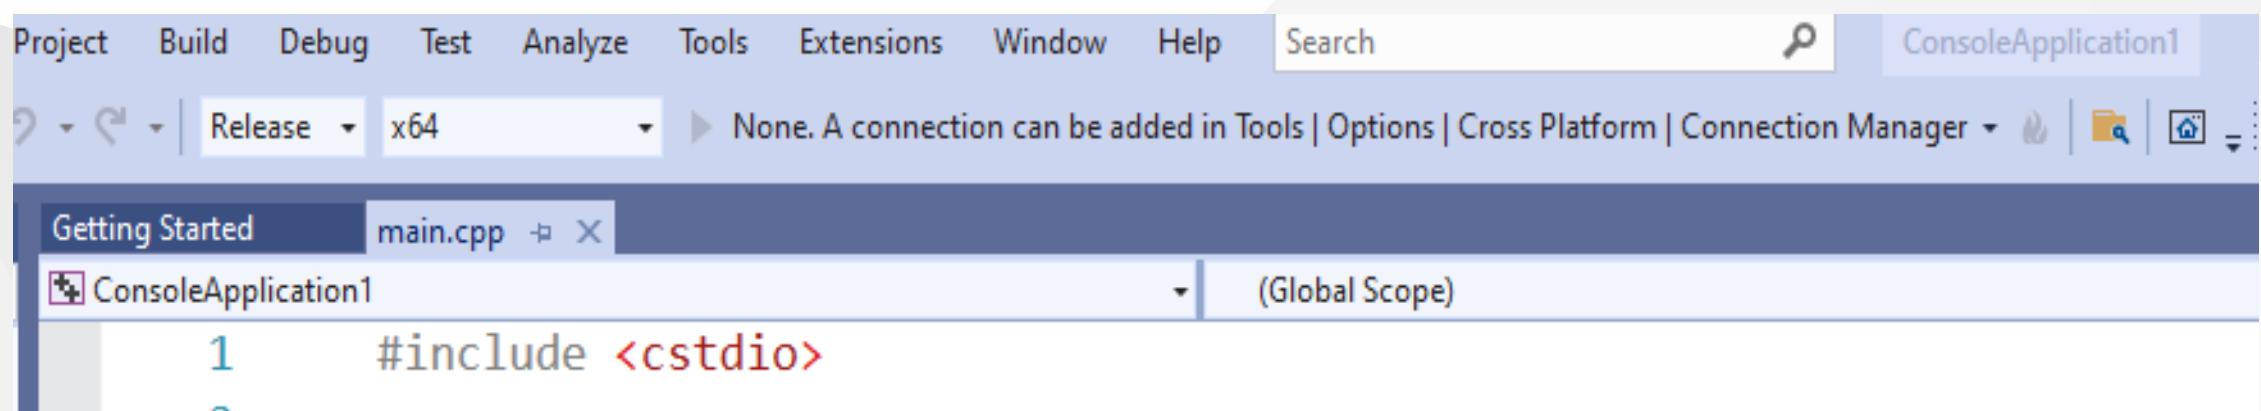

The screenshot shows the Microsoft Visual Studio IDE interface. The menu bar includes Project, Build, Debug, Test, Analyze, Tools, Extensions, Window, Help, and a Search bar. The toolbar contains various icons for file operations and debugging. The title bar shows "Getting Started" and "main.cpp". The code editor displays the following C++ code:

```
1 #include <cstdio>
2
3 int main()
4 {
5     printf("hello from %s!\n", "ConsoleApplication1");
6     return 0;
7 }
```

A red circular breakpoint marker is placed on the line before the opening brace of the main function. The code editor also shows "(Global Scope)" in the status bar.

In the debugger for WSL you can use local WSL installation but if you want to run it on Release setting it require a SSH connection.

## Configure SSH parameters

X

### Connect to Linux

This project uses remote builds, and a remote machine is required to host the builds and debug. Please enter the remote machine details below.

[Manage existing connections](#)

Port:

User name:

Authentication type:

Password:

so you have to complete the following steps.

## C/C++ Remote Linux Option over SSH

Enable SSH

[SSH on Windows Subsystem for Linux \(WSL\) | Illuminia Studios](#)

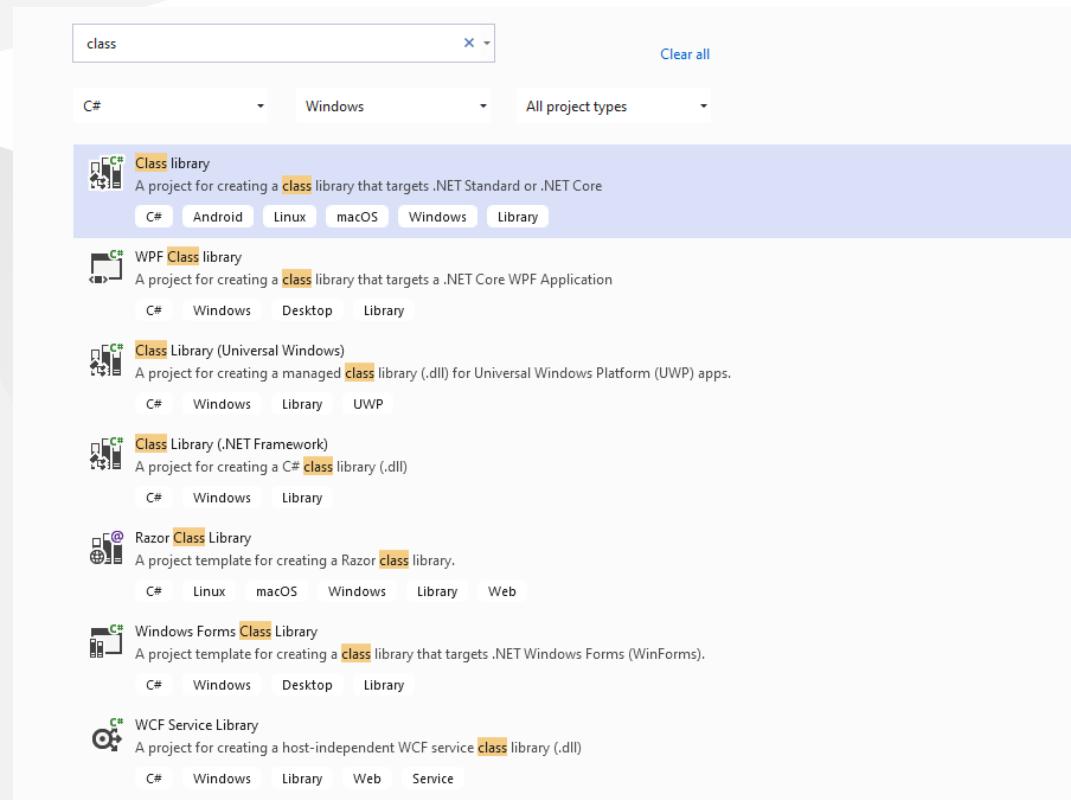

Connect to Remote WSL Environment

[Bağlan hedef Linux sisteminize Visual Studio | Microsoft Docs](#)

## C# Programming (Dinamik Library)

## Visual Studio Community Edition

In C# project we will create class library we have several options  
for this sample we will select .NET core that we can build cross platform library

<mark>There is no static library option</mark>

## Configure your new project

Class library   C#   Android   Linux   macOS   Windows   Library

Project name

csharp-sample-lib

Location

E:\UgurCoruh\RTEU\Lectures\2021-2022 Güz CE103 - Algorithms and Programming I\Lectures\ce11

...

Solution name i

csharp-sample-lib

Place solution and project in the same directory

We will select .Net Core 3.1

## Additional information

Class library    C#    Android    Linux    macOS    Windows    Library

Target Framework i

.NET Core 3.1 (Long-term support)

.NET Standard 2.0

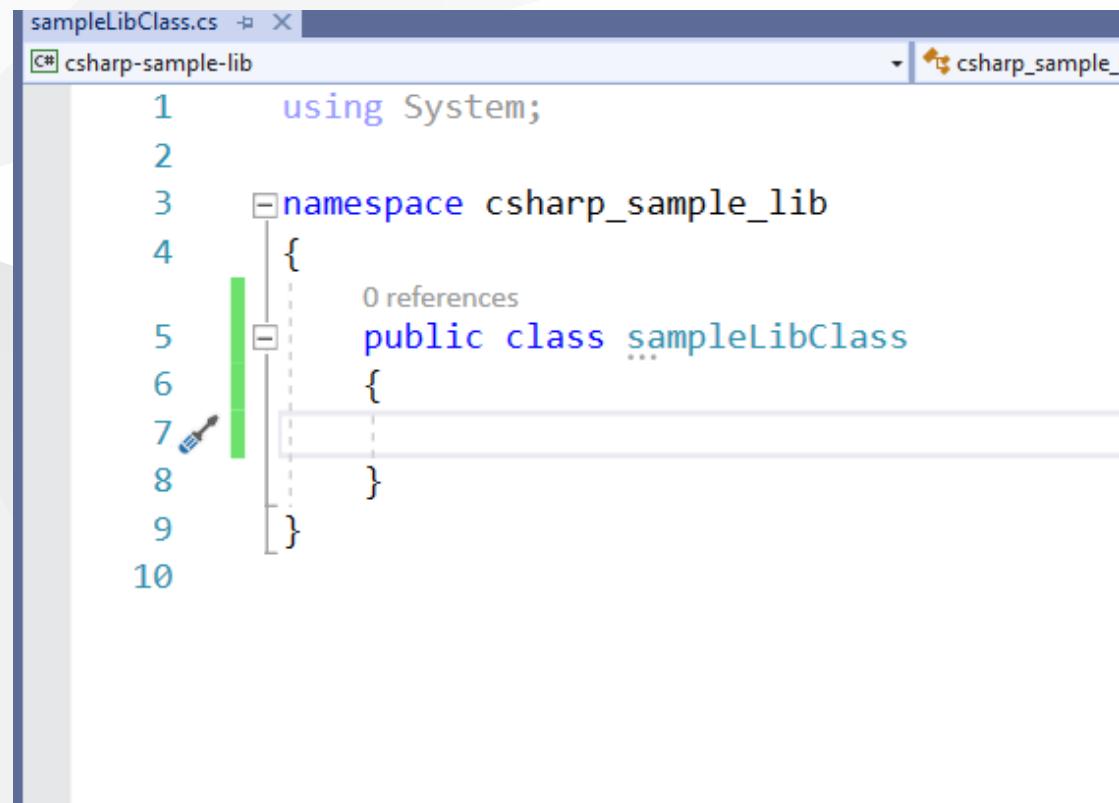

.NET Standard 2.1

.NET Core 2.1 (Long-term support)

.NET Core 3.1 (Long-term support)

.NET 5.0 (Current)

You will have default empty class library file

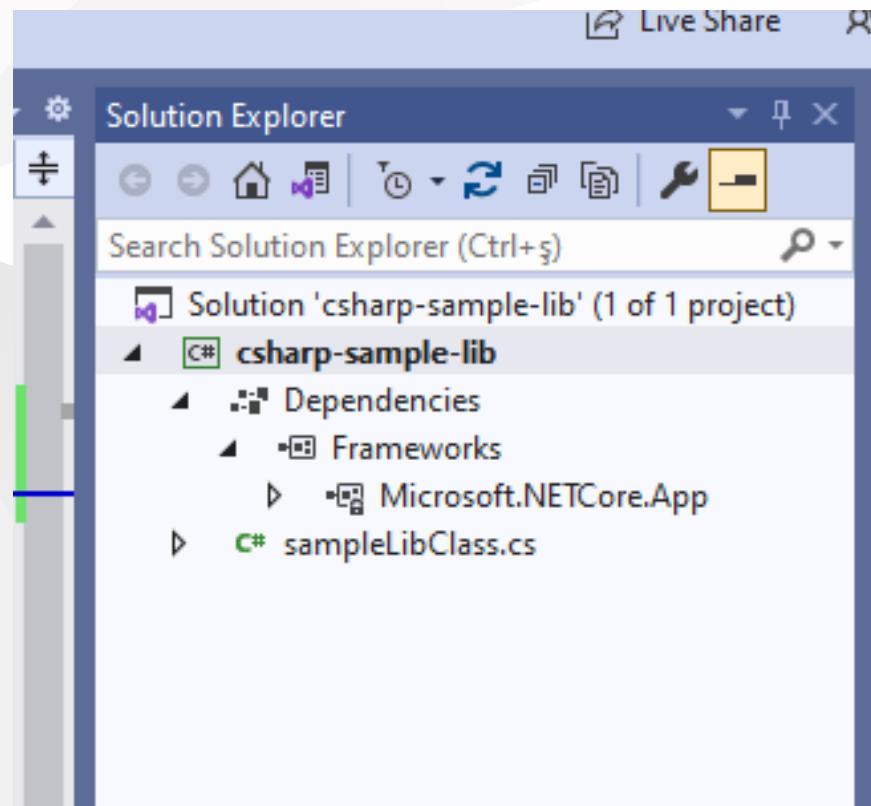

A screenshot of a code editor window titled "sampleLibClass.cs". The window shows the following C# code:

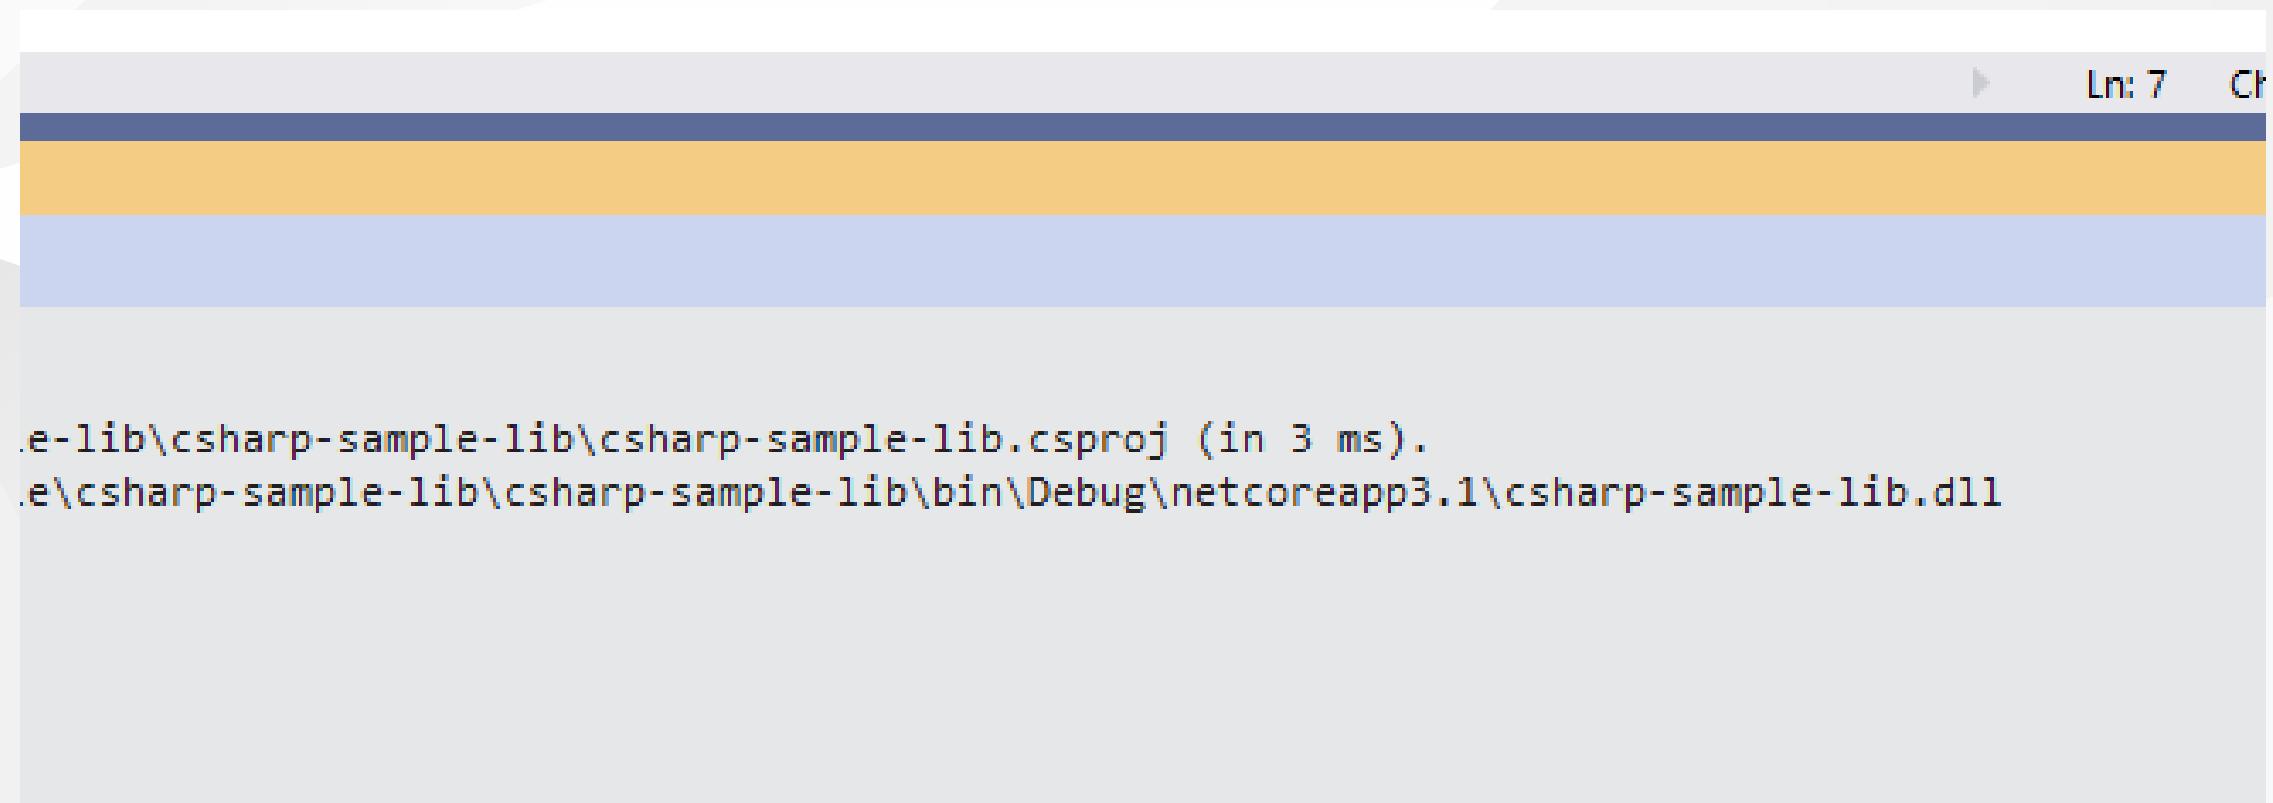

```
1  using System;
2
3  namespace csharp_sample_lib
4  {
5      public class sampleLibClass
6      {
7          ...
8      }
9  }
```

The code editor interface includes a toolbar at the top with icons for file operations like New, Open, Save, and Close. The status bar at the bottom displays the path "csharp-sample-lib" and the file name "sampleLibClass.cs". A green vertical bar on the left indicates the current line of code being edited.

In the project you can see .NETcore reference

We can build empty class library that generate dll for our application

The screenshot shows a terminal window with a dark blue header bar. In the header bar, there is a right-pointing arrow icon, the text "Ln: 7", and a "Ch" icon. The main area of the terminal is divided into three horizontal sections: a yellow section at the top, a light blue section in the middle, and a white section at the bottom where the command output is displayed. The output text is:  
.e-lib\csharp-sample-lib\csharp-sample-lib.csproj (in 3 ms).  
.e\csharp-sample-lib\csharp-sample-lib\bin\Debug\netcoreapp3.1\csharp-sample-lib.dll

Now we will add Console Application but this will also use .NETCore

## Select New Project

The screenshot shows the 'Select New Project' dialog in Visual Studio. At the top, there is a search bar labeled 'Search for templates (Alt+S)' with a magnifying glass icon and a 'Clear all' link. Below the search bar are three dropdown menus: 'C#' (selected), 'Windows' (selected), and 'All project types'. The main area displays two project templates:

- Console Application**: A project for creating a command-line application that can run on .NET Core on Windows, Linux and macOS. It has tags: C#, Linux, macOS, Windows, Console.
- ASP.NET Core Web App**: A project template for creating an ASP.NET Core application with example ASP.NET Razor Pages content. It has tags: C#, Linux, macOS, Windows, Cloud, Service, Web.

Name the project

## Configure your new project

Console Application    C#    Linux    macOS    Windows    Console

Project name

Location

...

## Select .NETCore framework

### Additional information

Console Application    C#    Linux    macOS    Windows    Console

Target Framework 

.NET Core 3.1 (Long-term support)

.NET Core 2.1 (Long-term support)

.NET Core 3.1 (Long-term support)

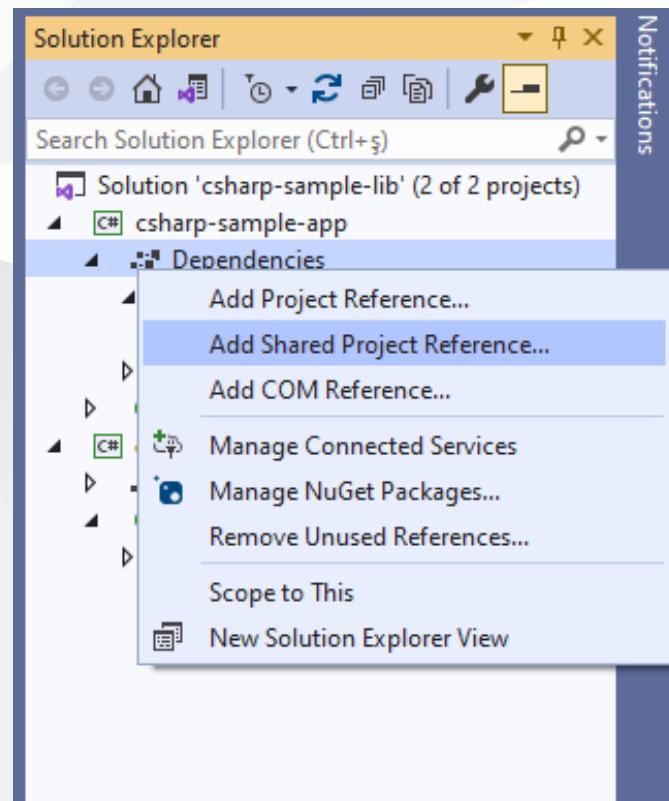

.NET 5.0 (Current)

You will have the following sample main.cs file

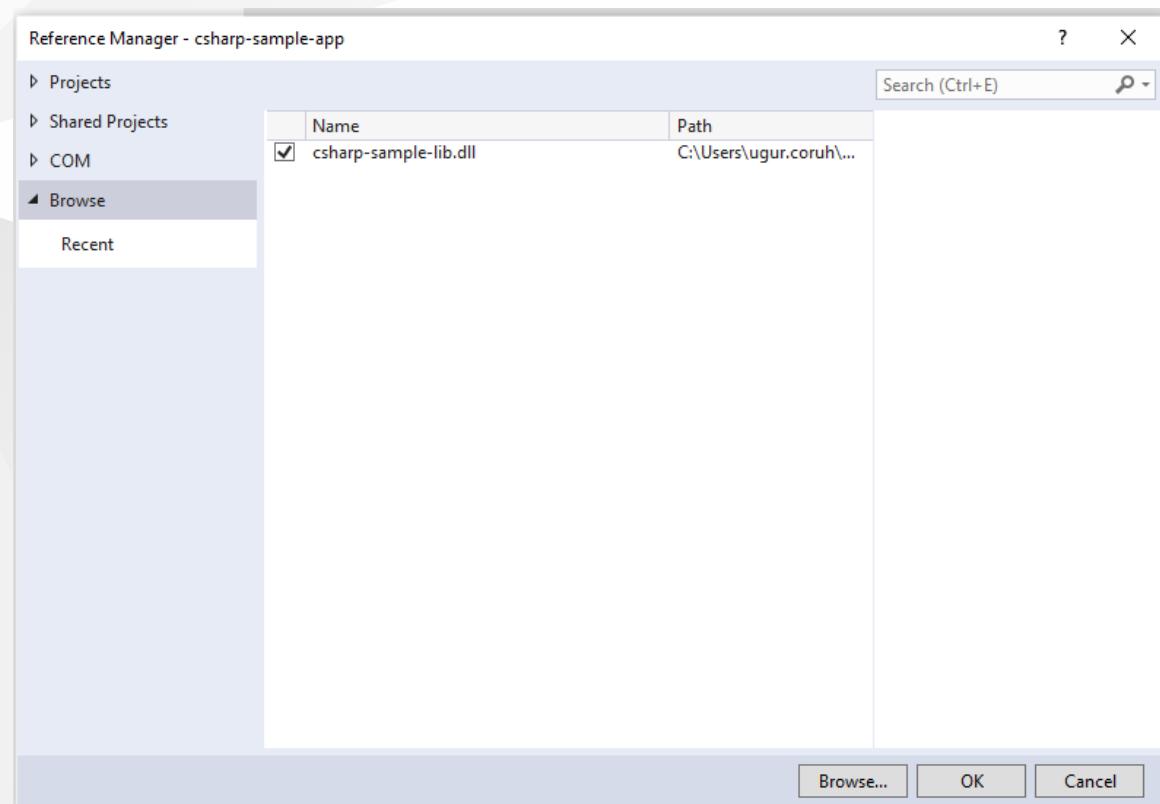

```
using System;

namespace csharp_sample_app
{
    class Program
    {
        static void Main(string[] args)
        {
            Console.WriteLine("Hello World!");
        }
    }
}
```

Now we can link projects with adding references open reference section

browse for class library project output folder and select output dll file for console application

now we can update our library code and use it in console application

copy following sample to sampleLibClass file in the library

```
using System;

namespace csharp_sample_lib
{
    public class sampleLibClass
    {
        public static void sayHelloTo(string name)
        {
            if (!String.IsNullOrEmpty(name))
            {
                Console.WriteLine("Hello " + name);
            }
            else
            {
                Console.WriteLine("Hello There");
            }
        }

        public static int sum(int a, int b)
        {
            int c = 0;
            c = a + b;
            return c;
        }
    }
}
```

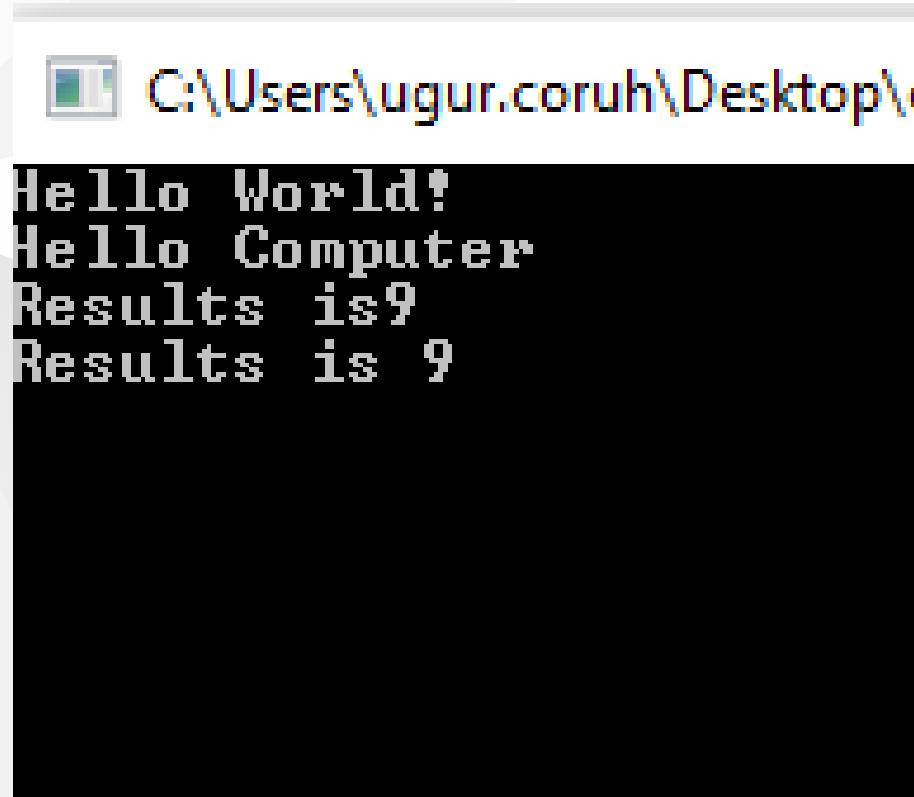

after this operation copy following sample to console application and build app then you can run

```
using csharp_sample_lib;
using System;

namespace csharp_sample_app
{
    class Program
    {
        static void Main(string[] args)
        {
            Console.WriteLine("Hello World!");

            sampleLibClass.sayHelloTo("Computer");
            int result = sampleLibClass.sum(5, 4);
            Console.WriteLine("Results is " + result);
            Console.WriteLine("Results is {0}", result);
            Console.Read();
        }
    }
}
```

You will see following output that mean we called DLL functions

```
C:\Users\ugur.coruh\Desktop\c
Hello World!
Hello Computer
Results is 9
Results is 9
```

Also we can publish this console application with dll for linux environment or others  
for linux environment we should install .NETCore

follow the link below or commands that I shared with you as below for deployment

## [How to Install Dotnet Core on Ubuntu 20.04 – TecAdmin](#)

Step 1 – Enable Microsoft PPA

```
wget https://packages.microsoft.com/config/ubuntu/20.04/packages-microsoft-prod.deb  
sudo dpkg -i packages-microsoft-prod.deb
```

## Step 2 – Installing Dotnet Core SDK

```
sudo apt update  
sudo apt install apt-transport-https  
sudo apt install dotnet-sdk-3.1
```

### Step 3 – Install Dotnet Core Runtime Only

To install .NET Core Runtime on Ubuntu 20.04 LTS system, execute the commands:

```
sudo apt update
```

To install the previous version of .Net core runtime 2.1, type:

```
sudo apt install dotnet-runtime-2.1
```

Press "y" for any input prompted by the installer.

## Step 4 – (Optional) Check .NET Core Version

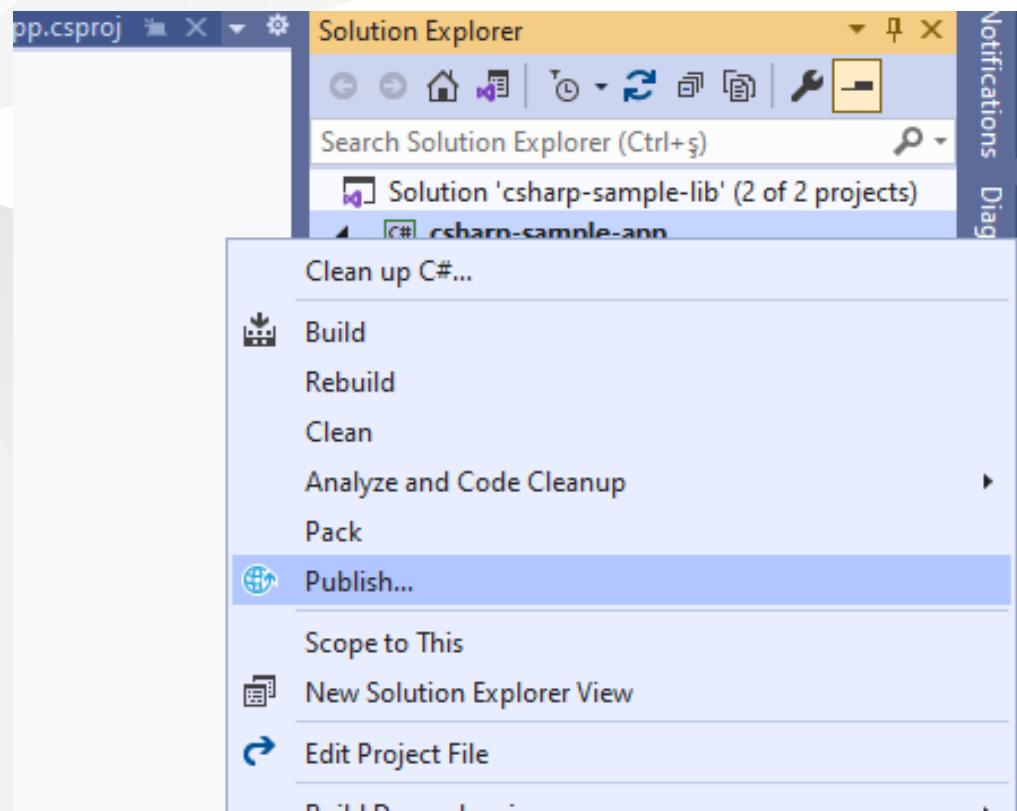

You can use dotnet command line utility to check installed version of .NET Core on your system. To check dotnet version, type:

```
dotnet --version
```

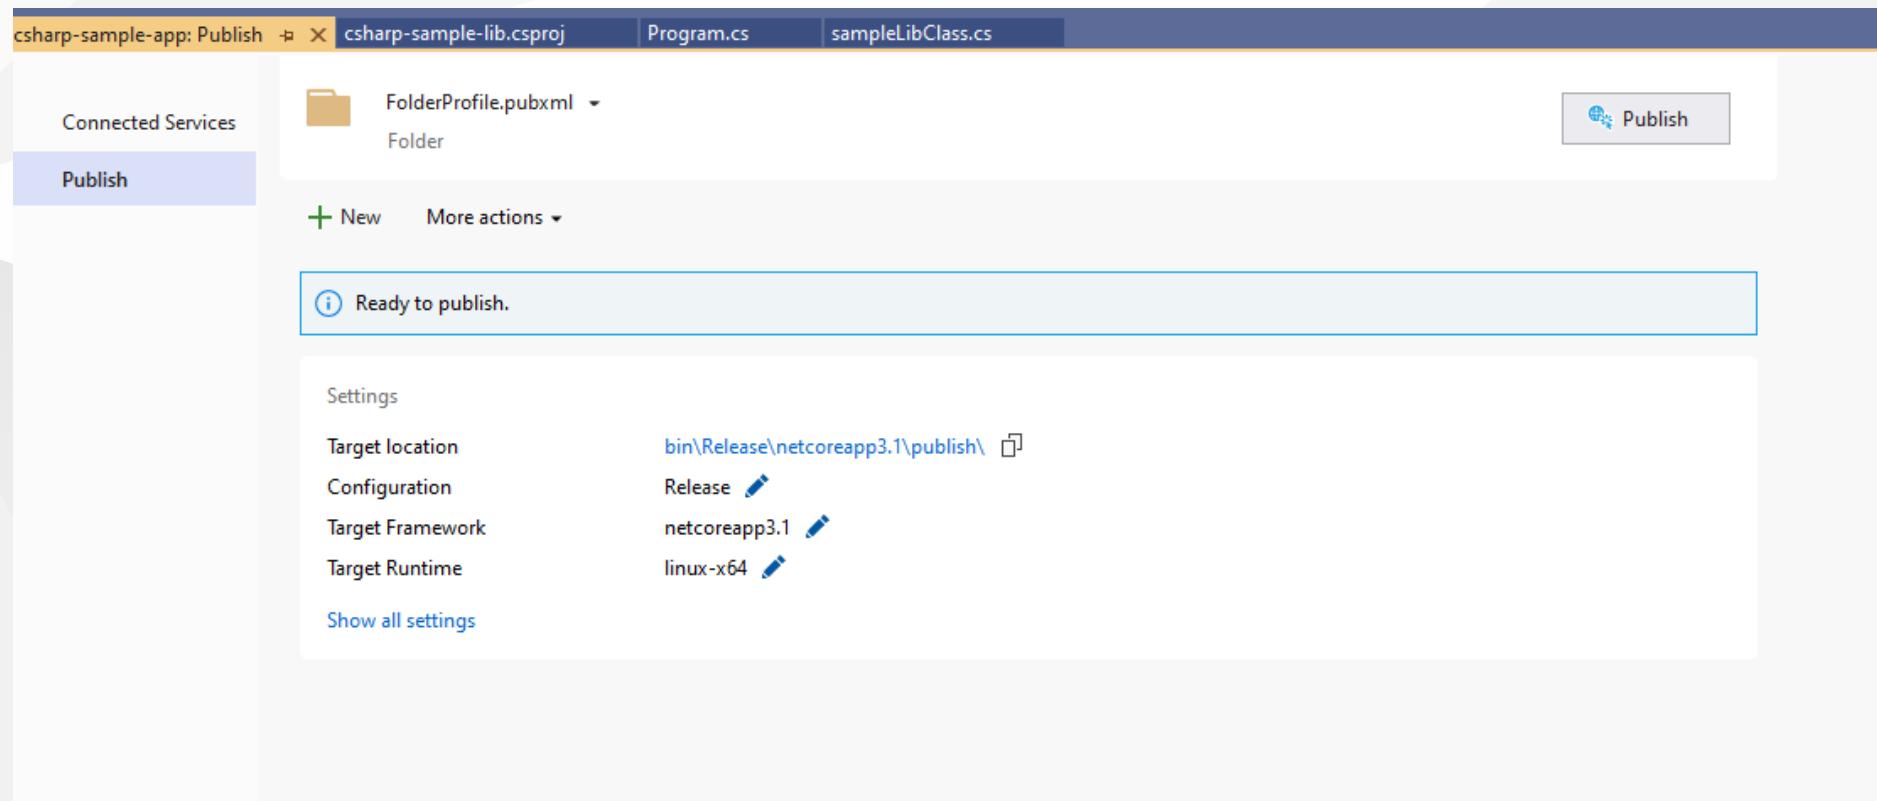

```
ucoruh@LAPTOP-RQNNNS:~$ dotnet --version  
3.1.414  
ucoruh@LAPTOP-RQNNNS:~$
```

Now we will publish our application as single executable

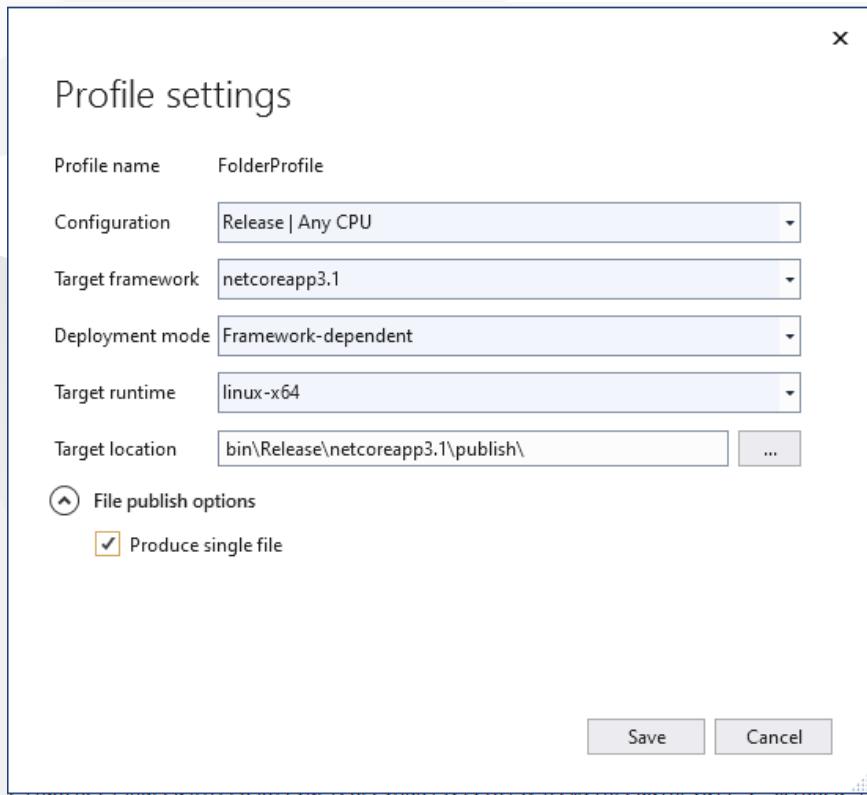

Open publish menu

## Select netcoreapp3.1 and Release for linux-x64

## Select produce single file

After successfull publish you will have linux binary that you can run with WSL

```
esktop > csharp-lib-sample > csharp-sample-lib > csharp-sample-app > bin > Release > netcoreapp3.1 > publish
```

Name	Date modified	Type	Size
csharp-sample-app	10/24/2021 1:36 AM	File	97 KB
csharp-sample-app.pdb	10/24/2021 1:36 AM	Program Debug D...	10 KB
csharp-sample-lib.pdb	10/24/2021 1:30 AM	Program Debug D...	10 KB
packages-microsoft-prod.deb	4/23/2020 10:02 PM	DEB File	4 KB

Open WSL and enter the path where this folder located  
and run application as follow

```
Processing triggers for man-db (2.9.1-1) ...
ucoruh@LAPTOP-RQNN9IG:/mnt/c/Users/ugur.coruh/Desktop/csharp-lib-sample/csharp-sample-lib/csharp-sample-app/bin/Release/netcoreapp3.1/publish$ dotnet --version
3.1.414
ucoruh@LAPTOP-RQNN9IG:/mnt/c/Users/ugur.coruh/Desktop/csharp-lib-sample/csharp-sample-lib/csharp-sample-app/bin/Release/netcoreapp3.1/publish$ ./
csharp-sample-app      csharp-sample-app.pdb      csharp-sample-lib.pdb      packages-microsoft-prod.deb
ucoruh@LAPTOP-RQNN9IG:/mnt/c/Users/ugur.coruh/Desktop/csharp-lib-sample/csharp-sample-lib/csharp-sample-app/bin/Release/netcoreapp3.1/publish$ ./csharp-sample-app
Hello World!
Hello Computer
Results is9
Results is 9
```

check dotnet --version and then run application

```
ublish$ dotnet --version  
ublish$ ./  
ublish$ ./csharp-sample-app
```

you will see similar output

```
ucoruh@LAPTOP-RQNN9IG:/mnt/c/  
csharp-sample-app  
ucoruh@LAPTOP-RQNN9IG:/mnt/c/  
Hello World!  
Hello Computer  
Results is9  
Results is 9
```

In this sample we created single application from settings lets try with shared library located option uncheck the "produce single file" option and publish again.

Then you will have the following outputs

top > csharp-lib-sample > csharp-sample-lib > csharp-sample-app > bin > Release > netcoreapp3.1 > publish				
Name	Date modified	Type	Size	
csharp-sample-app	10/24/2021 1:36 AM	File	88 KB	
csharp-sample-app.deps.json	10/24/2021 1:36 AM	JSON File	1 KB	
csharp-sample-app.dll	10/24/2021 1:36 AM	Application exten...	4 KB	
csharp-sample-app.pdb	10/24/2021 1:36 AM	Program Debug D...	10 KB	
csharp-sample-app.runtimeconfig.json	10/24/2021 1:36 AM	JSON File	1 KB	
csharp-sample-lib.dll	10/24/2021 1:30 AM	Application exten...	4 KB	
csharp-sample-lib.pdb	10/24/2021 1:30 AM	Program Debug D...	10 KB	

If you run csharp-sample-app  
you will have the same output

```
ucoruh@LAPTOP-RQNN5I: ~
Hello World!
Hello Computer
Results is9
Results is 9
```

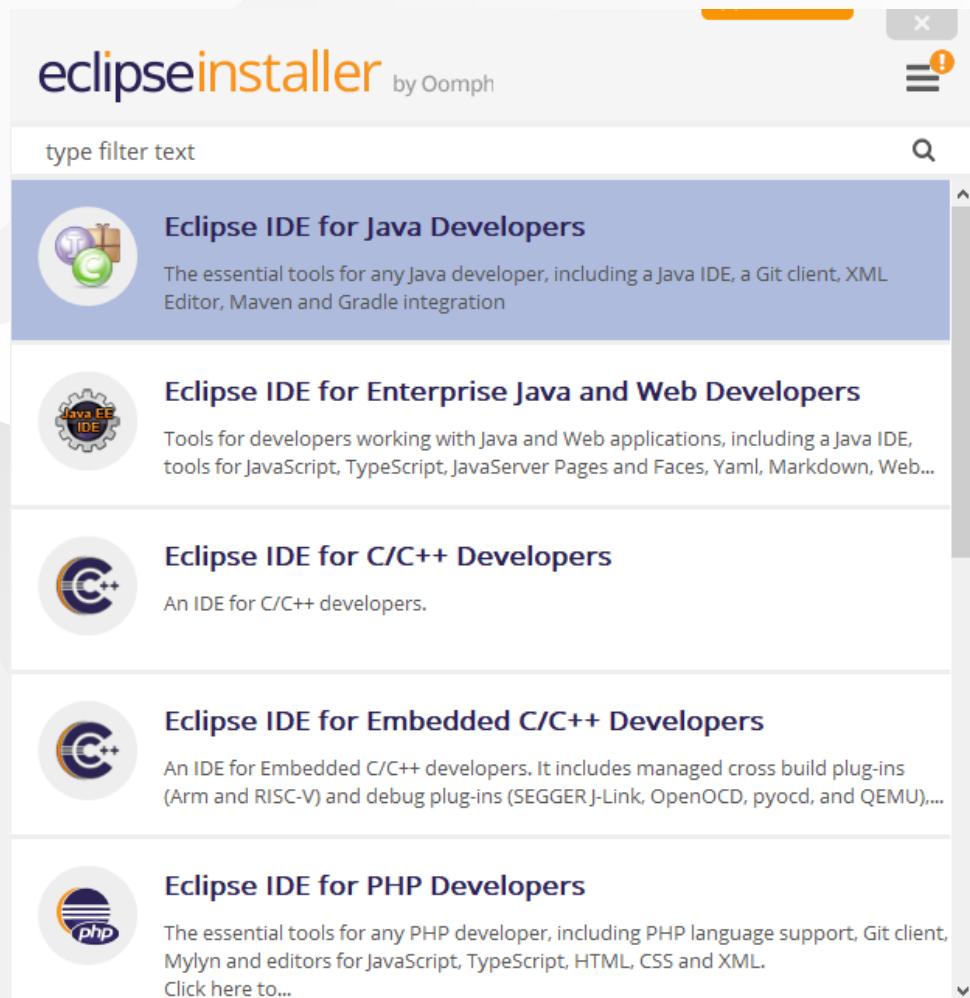

# Java Programming

# Eclipse IDE

You should download and install eclipse installer and then you should select Eclipse IDE for Java Developers

Eclipse Installer 2021-09 R | Eclipse Packages

The screenshot shows the Eclipse Installer interface, which is a web-based application for selecting and installing different Eclipse IDE editions. The interface includes a header with the title "eclipseinstaller by Oomph" and a search bar. Below the search bar is a "type filter text" input field and a magnifying glass icon. The main content area displays five distinct Eclipse IDE options, each with a small icon and a brief description:

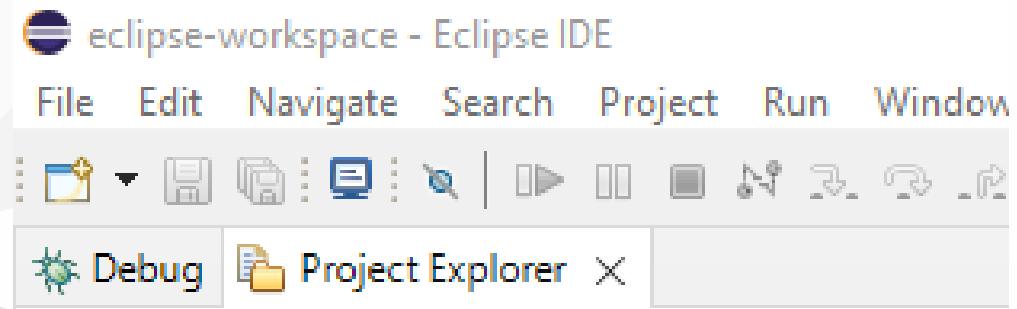

- Eclipse IDE for Java Developers**: The essential tools for any Java developer, including a Java IDE, a Git client, XML Editor, Maven and Gradle integration.
- Eclipse IDE for Enterprise Java and Web Developers**: Tools for developers working with Java and Web applications, including a Java IDE, tools for JavaScript, TypeScript, JavaServer Pages and Faces, Yaml, Markdown, Web...
- Eclipse IDE for C/C++ Developers**: An IDE for C/C++ developers.
- Eclipse IDE for Embedded C/C++ Developers**: An IDE for Embedded C/C++ developers. It includes managed cross build plug-ins (Arm and RISC-V) and debug plug-ins (SEGGER J-Link, OpenOCD, pyocd, and QEMU),...
- Eclipse IDE for PHP Developers**: The essential tools for any PHP developer, including PHP language support, Git client, Mylyn and editors for JavaScript, TypeScript, HTML, CSS and XML.  
[Click here to...](#)

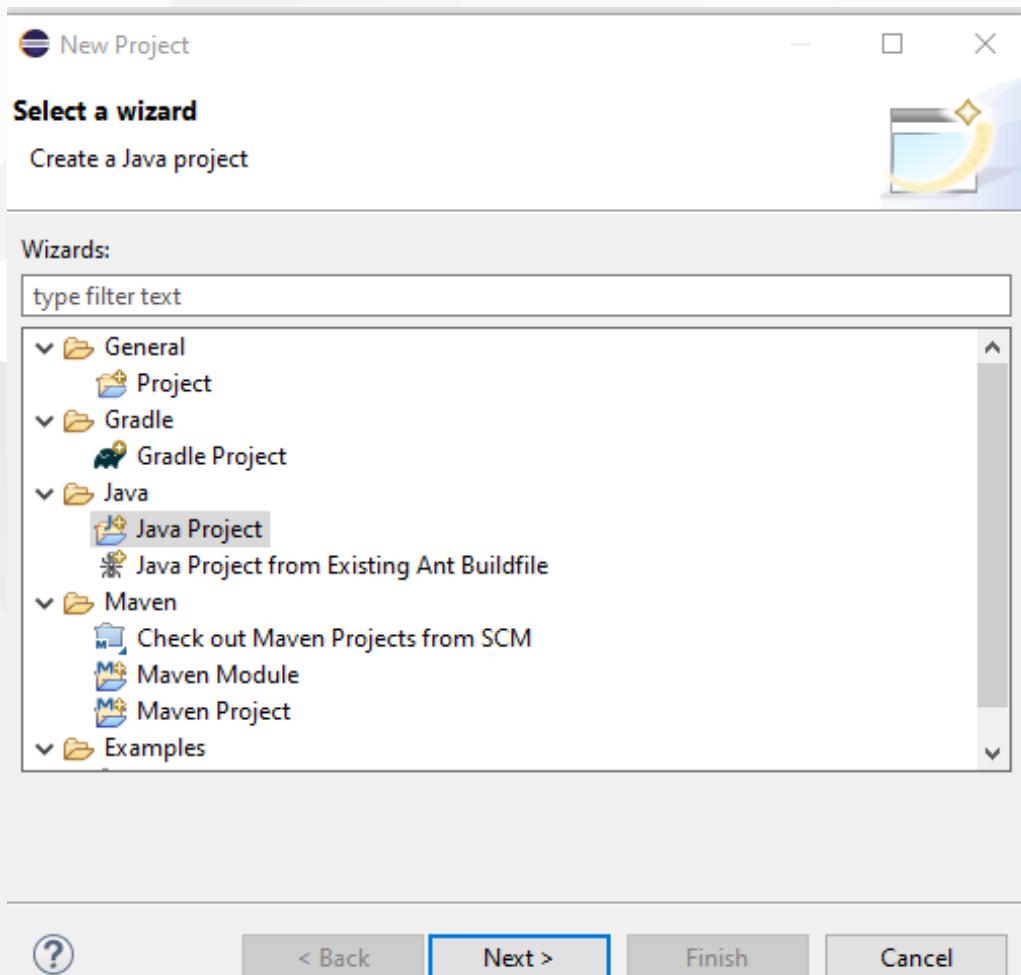

## select create a project

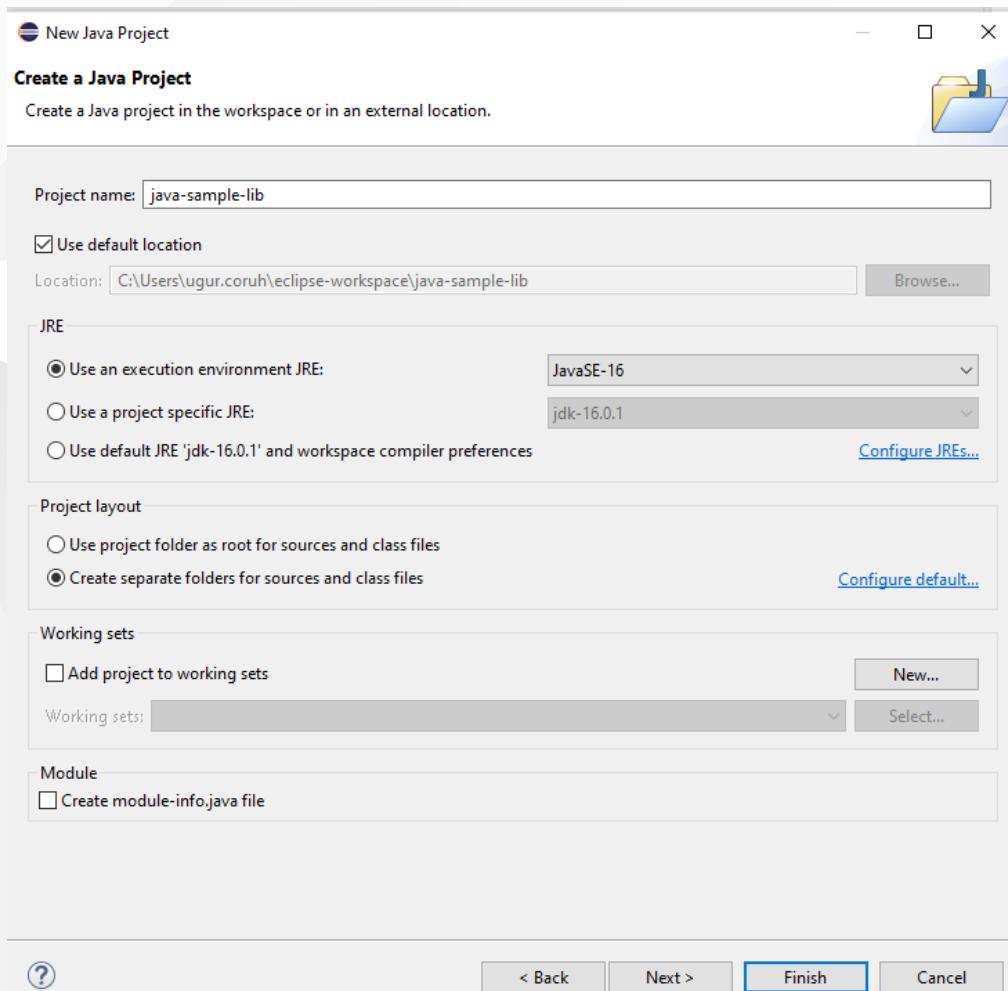

<TODO>

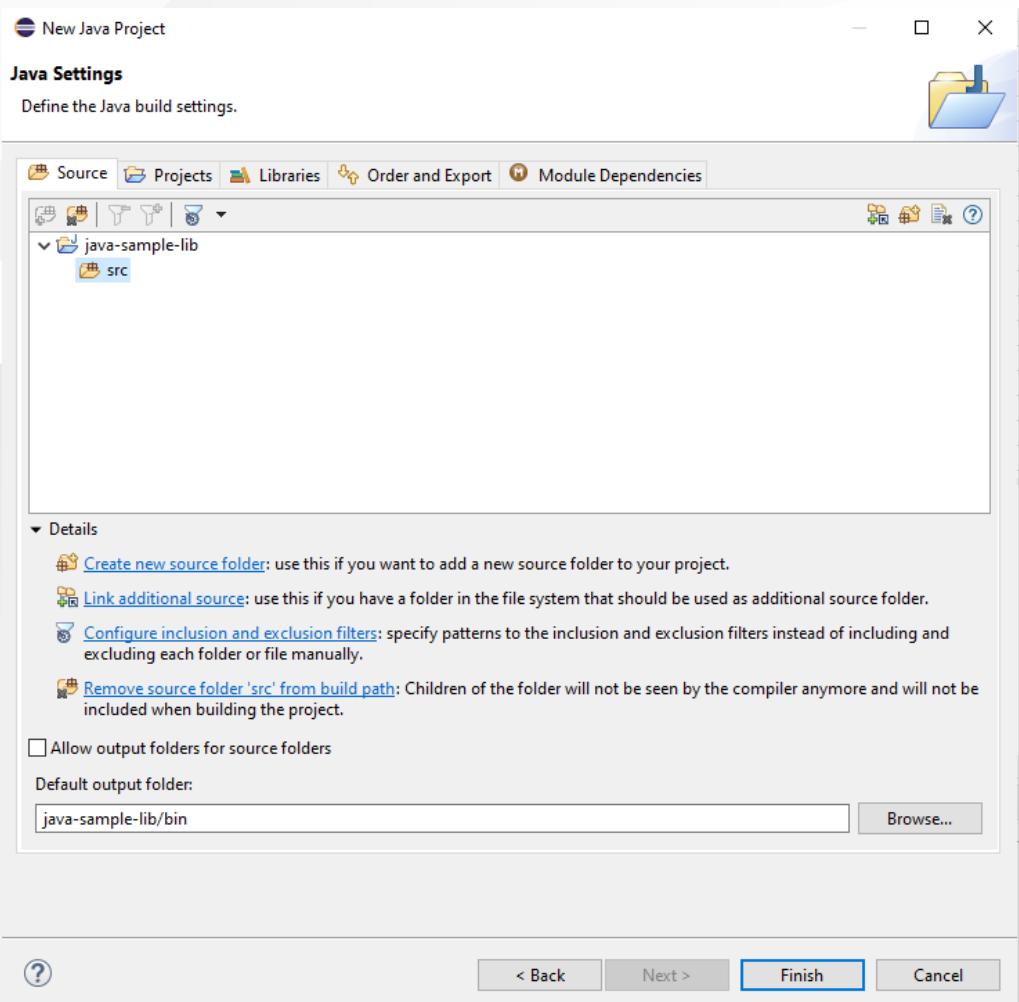

## select java project

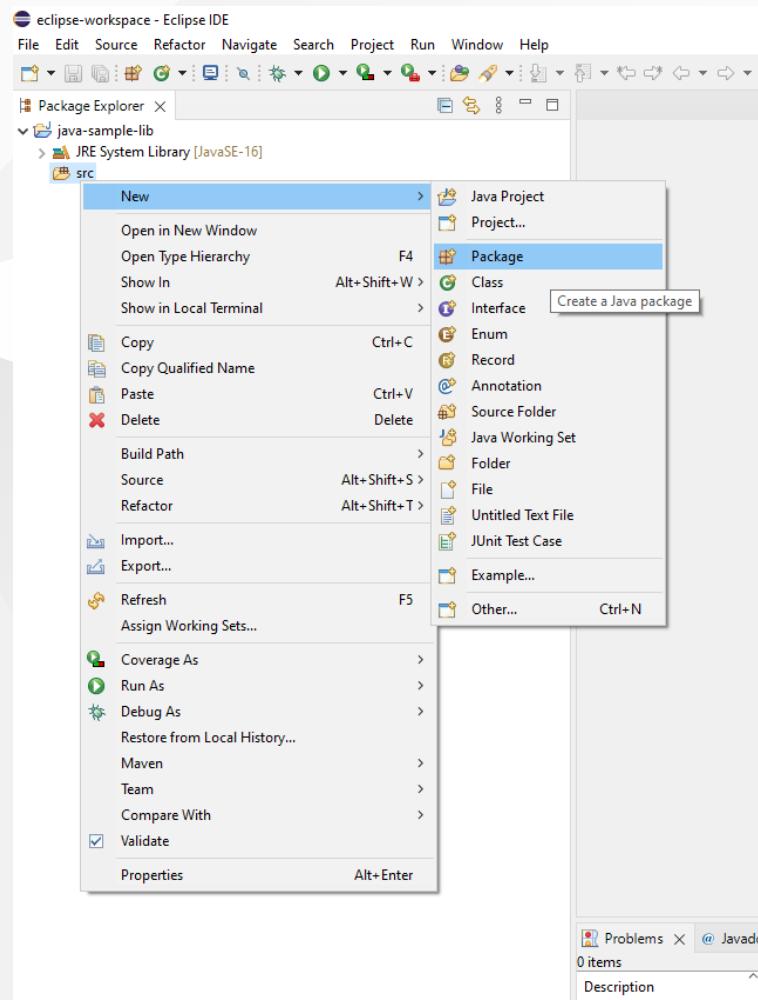

## give project name

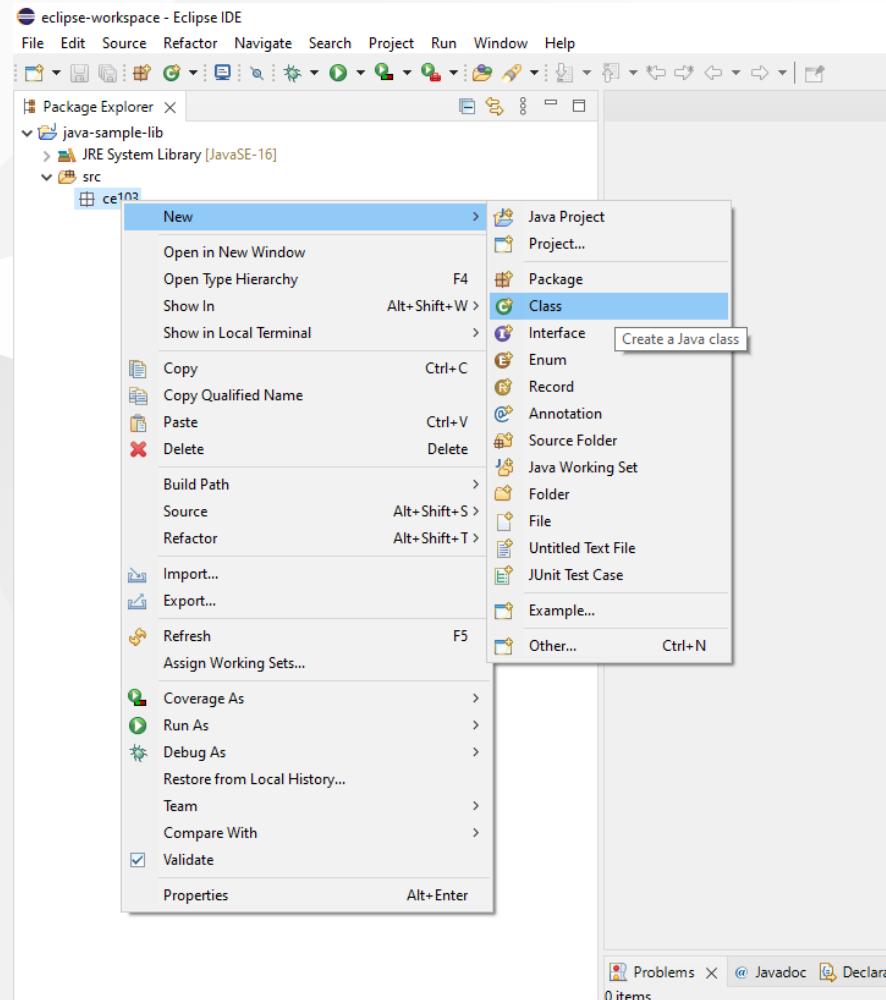

select finish

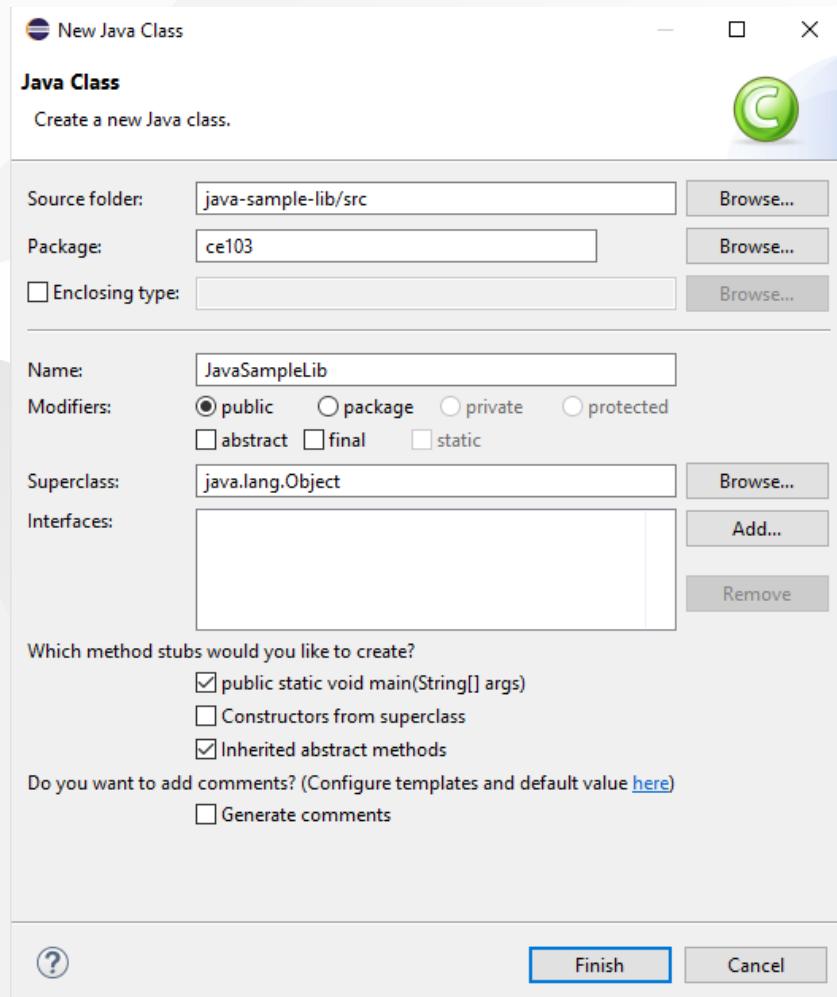

first we need to add a default package to keep everything organized

then we can create our class that includes our functions

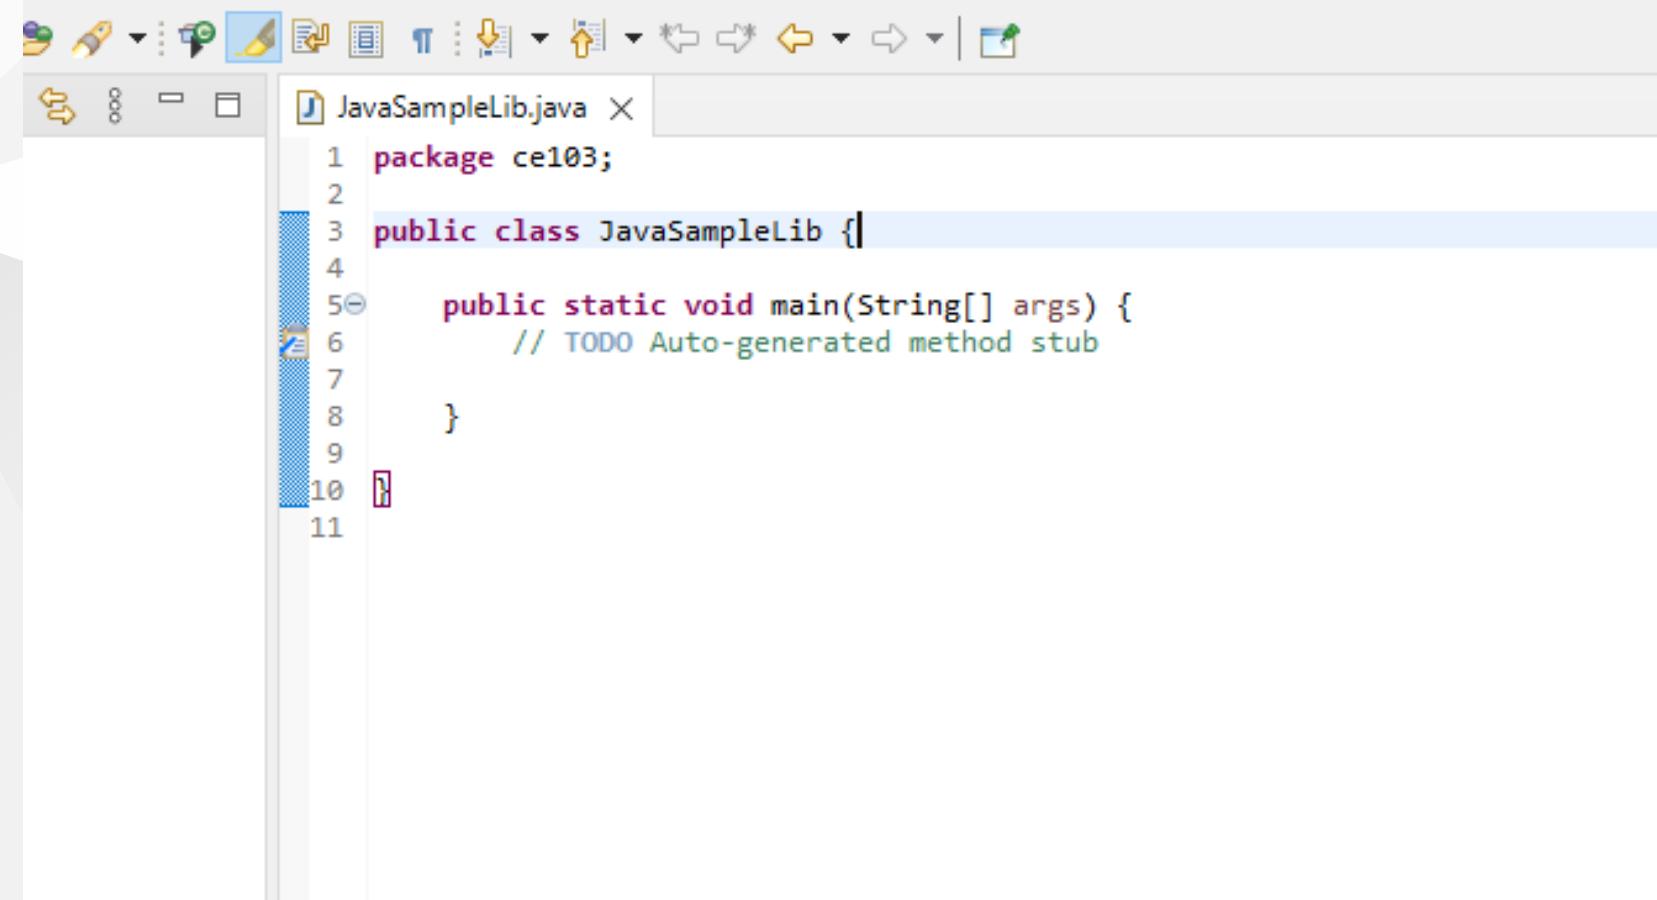

## give class a name

you will have following class with main

Eclipse IDE

Window Help

A screenshot of the Eclipse IDE interface. The title bar shows "JavaSampleLib.java". The code editor displays the following Java code:

```
1 package ce103;
2
3 public class JavaSampleLib {
4
5     public static void main(String[] args) {
6         // TODO Auto-generated method stub
7
8     }
9
10}
11
```

## We will create sample java library with static functions as below.

```
package ce103;

import java.io.IOException;

public class JavaSampleLib {

    public static void sayHelloTo(String name) {
        if(name.isBlank() || name.isEmpty())
        {
            System.out.println("Hello "+name);
        }else {
            System.out.println("Hello There");
        }
    }

    public static int sum(int a,int b)
    {
        int c = 0;
        c = a+b;
        return c;
    }

    public static void main(String[] args) {
        // TODO Auto-generated method stub
        System.out.println("Hello World!");

        JavaSampleLib.sayHelloTo("Computer");
        int result = JavaSampleLib.sum(5, 4);
        System.out.println("Results is" + result);
        System.out.printf("Results is %d \n", result);

        try {
            System.in.read();
        } catch (IOException e) {
            // TODO Auto-generated catch block
            e.printStackTrace();
        }
    }
}
```

also we can add main method to run our library functions. If we run this file its process main function

we can see output from console as below

The screenshot shows the Eclipse IDE interface with the following details:

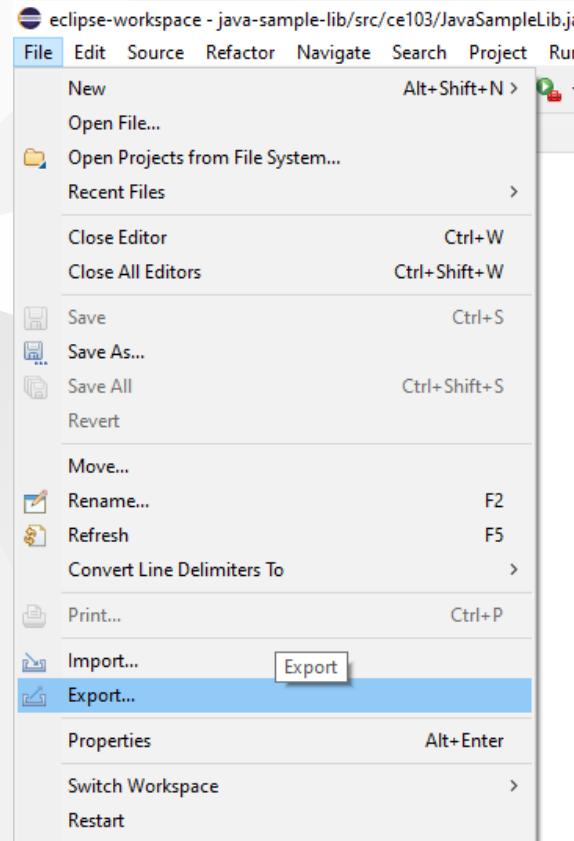

- File Menu:** File, Edit, Source, Refactor, Navigate, Search, Project, Run, Window, Help.
- Package Explorer:** Shows a project named "java-sample-lib" containing a package "ce103" which has a file "JavaSampleLib.java".
- Java Sample Library Code:** The code is as follows:

```
1 package ce103;
2
3 import java.io.IOException;
4
5 public class JavaSampleLib {
6
7     public static void sayHelloTo(String name) {
8         if(name.isBlank() || name.isEmpty())
9             {
10                 System.out.println("Hello "+name);
11             }else {
12                 System.out.println("Hello There");
13             }
14     }
15
16     public static int sum(int a,int b)
17     {
18         int c = 0;
19         c = a+b;
20         return c;
21     }
22
23     public static void main(String[] args) {
24         // TODO Auto-generated method stub
25         System.out.println("Hello World!");
26
27         JavaSampleLib.sayHelloTo("Computer");
28         int result = JavaSampleLib.sum(5, 4);
29         System.out.println("Results is" + result);
30         System.out.printf("Results is %d \n", result);
31
32         try {
33             System.in.read();
34         } catch (IOException e) {
35             // TODO Auto-generated catch block
36             e.printStackTrace();
37         }
38     }
39
40 }
41
42 }
```

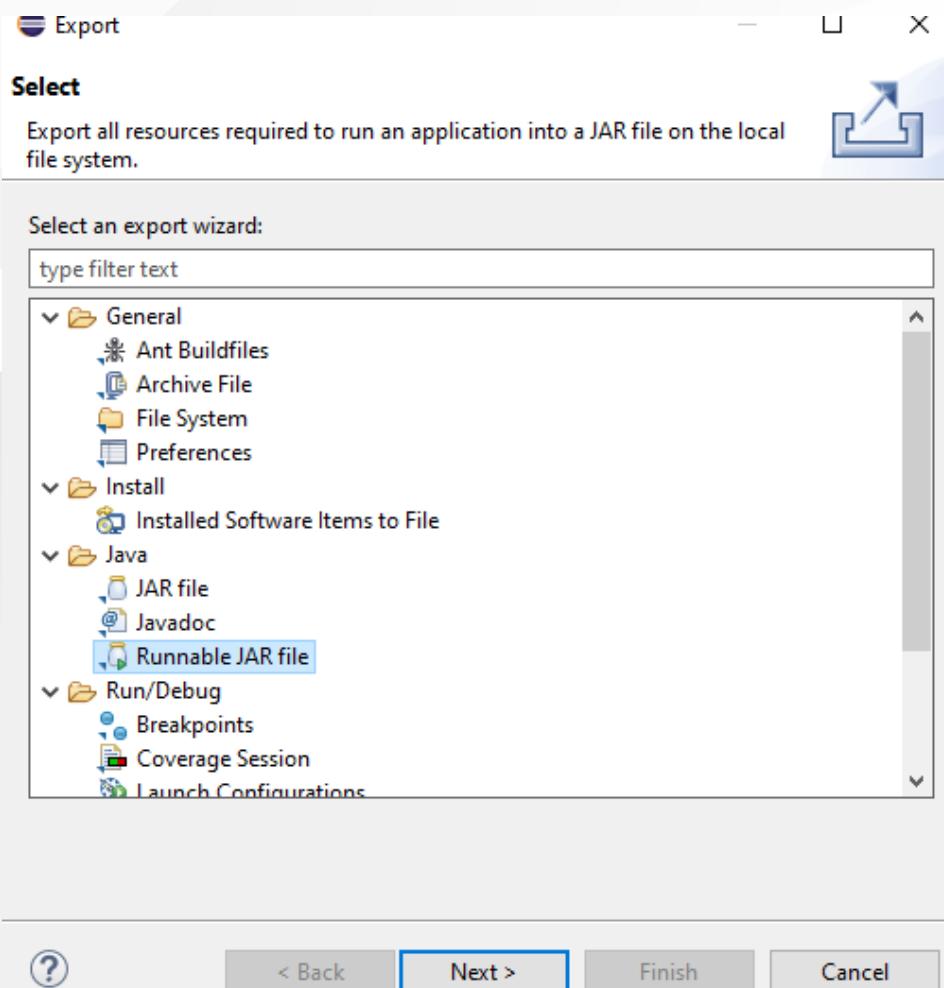

- Console View:** Shows the output of the program execution:

```
Hello World!
Hello There
Results is9
Results is 9
```

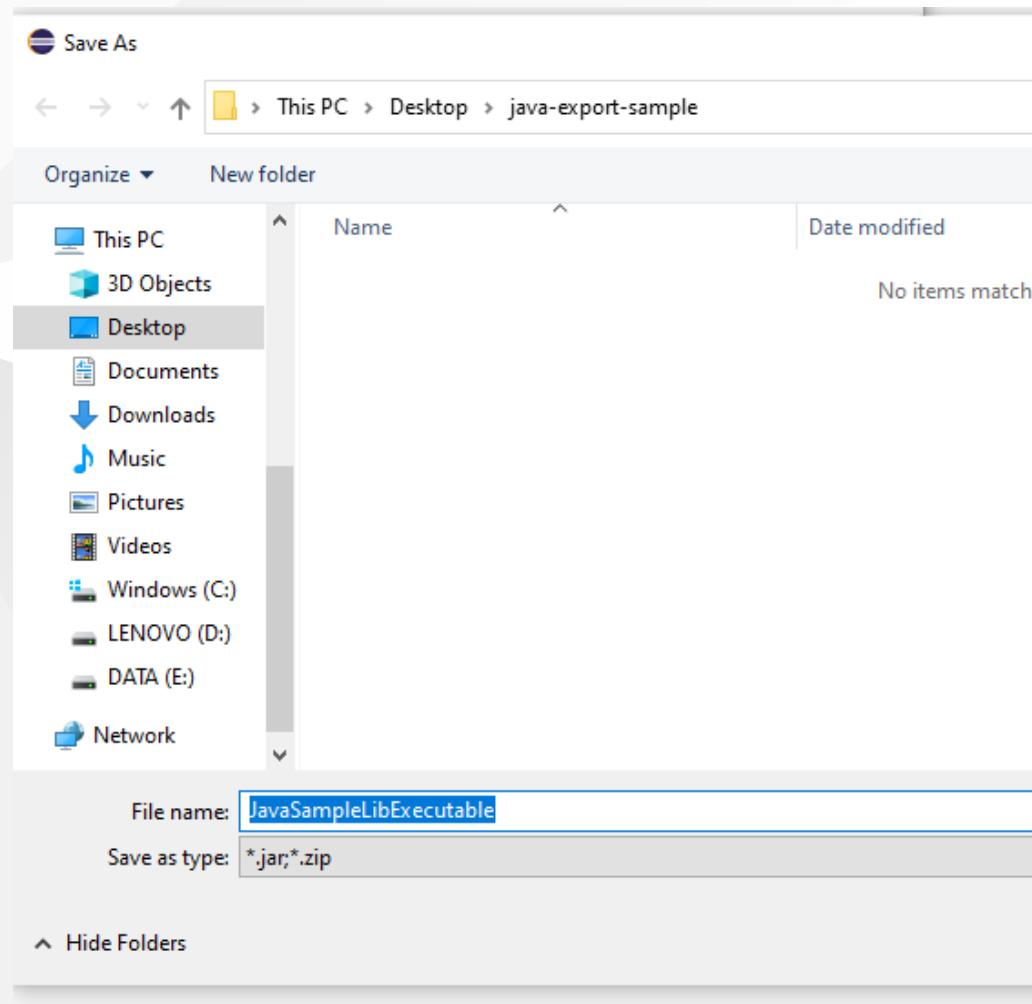

There is no exe files java runtime environment run class files but we can export this as an executable.

## Select Java->Runnable JAR File

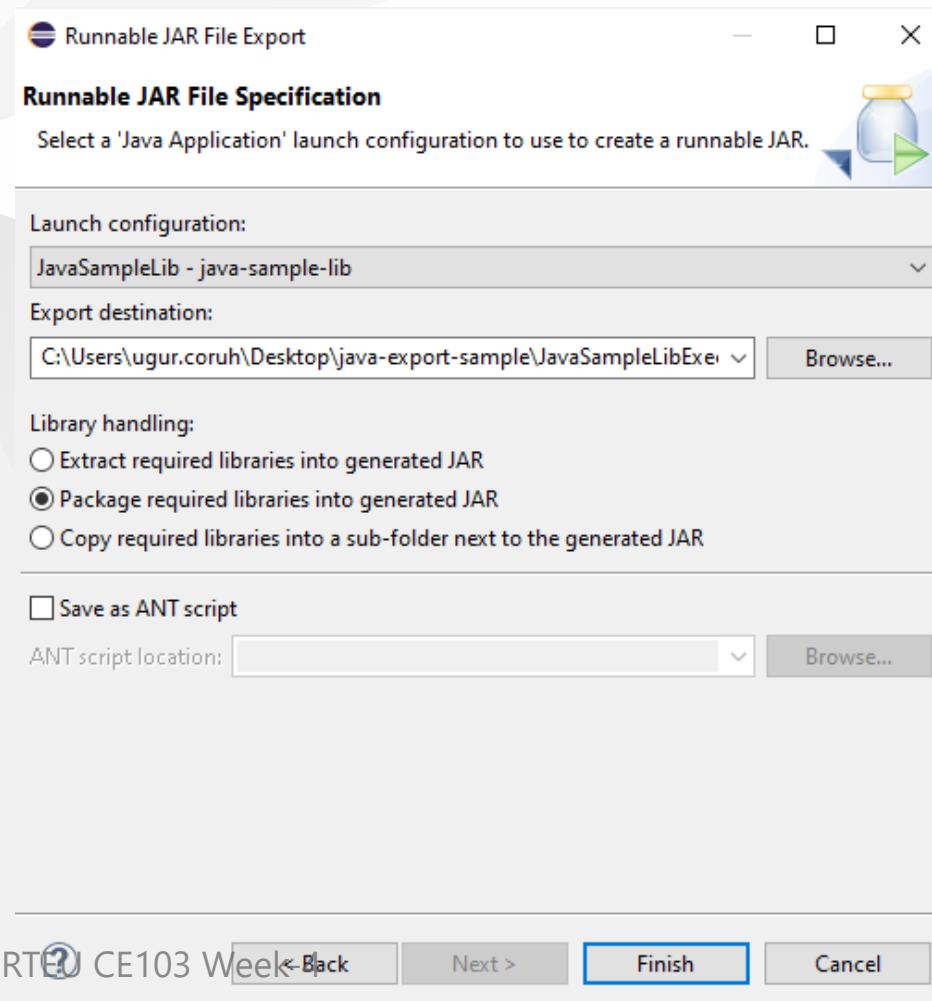

click next and set output path for jar file

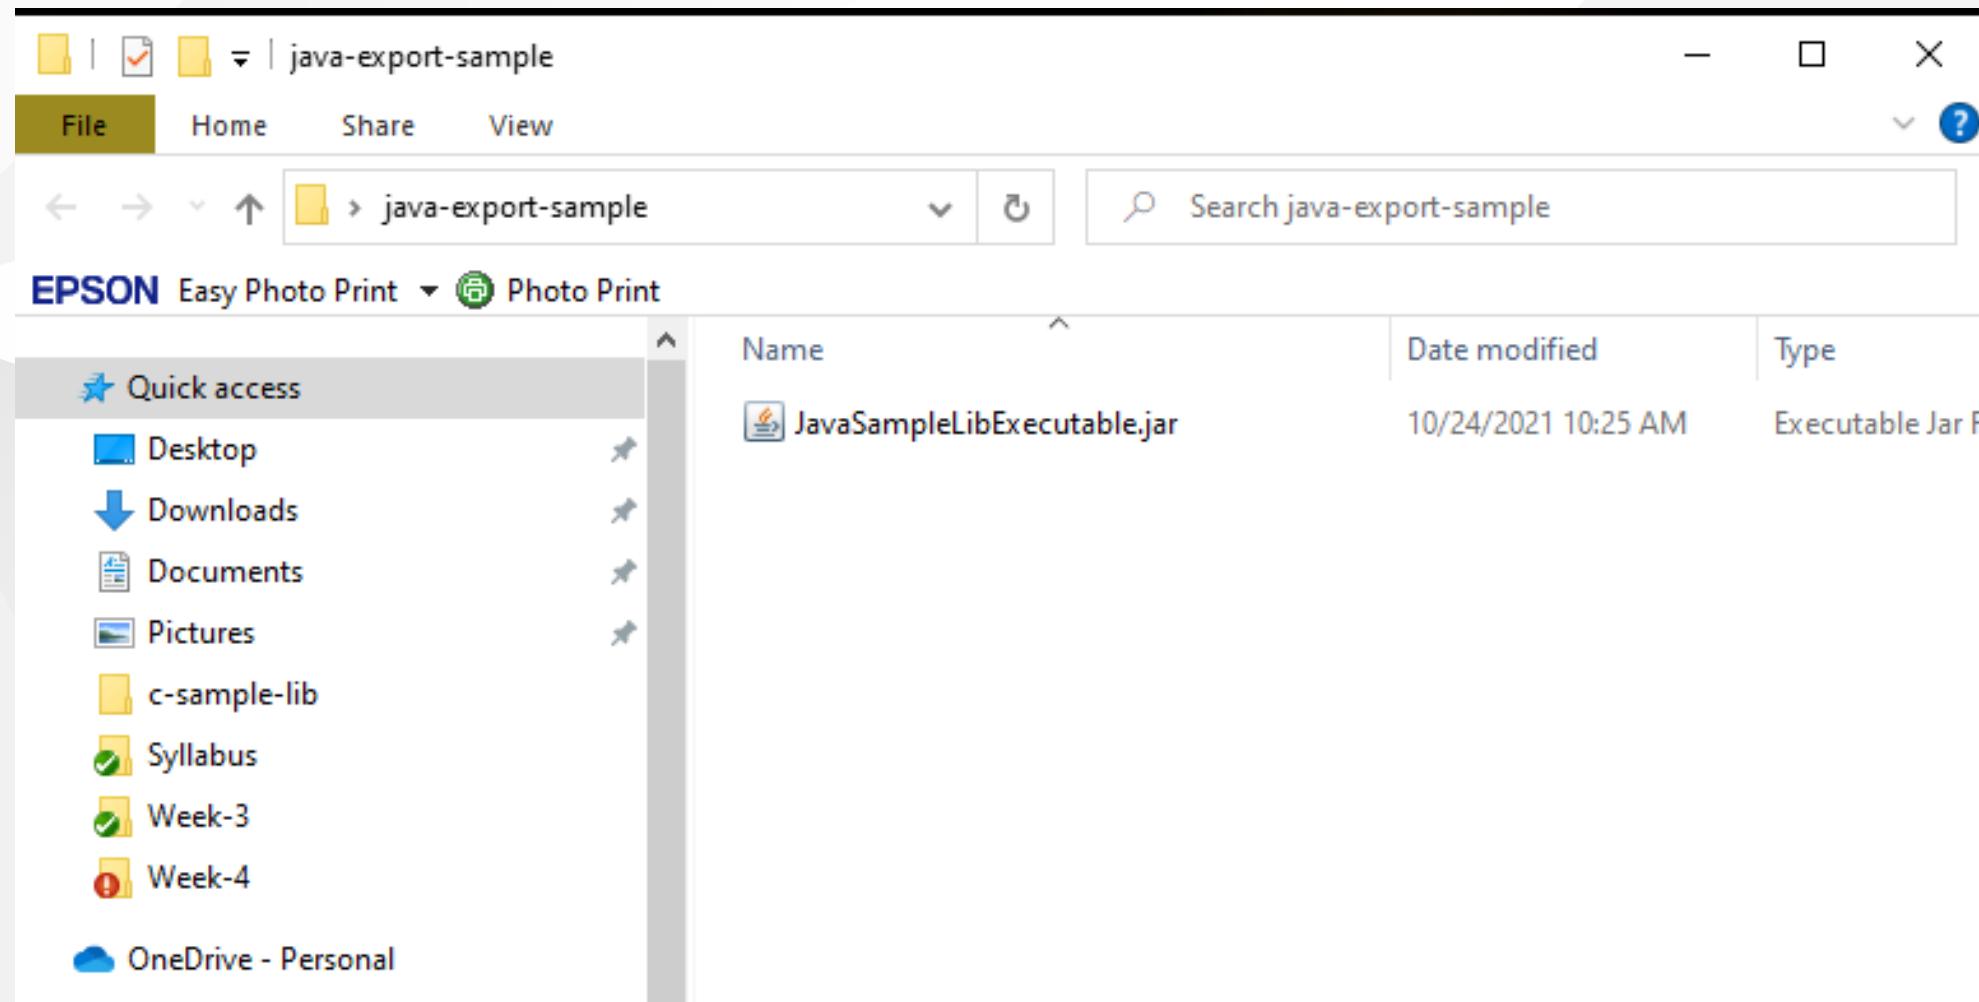

If our project has several external dependency then we can extract this required files (jar, so, dll) in seperated folder or we can combine them and generate a single executable jar

Lets pack everthing together, Select launch configuration that has main function

end of this operation we will have the following jar that we can by click

When you click application if cannot run then try command line to see problem

enter jar folder and run the following command

```
java -jar JavaSampleLibExecutable.jar
```

```
C:\Users\ugur.coruh\Desktop\java-export-sample>java -jar JavaSampleLibExecutable.jar
Exception in thread "main" java.lang.UnsupportedClassVersionError: ce103/JavaSampleLib has been compiled by a more recent
version of the Java Runtime (class file version 60.0), this version of the Java Runtime only recognizes class file ver-
sions up to 52.0

        at org.eclipse.jdt.internal.jarinjarloader.JarRsrcLoader.main(JarRsrcLoader.java:59)

C:\Users\ugur.coruh\Desktop\java-export-sample>
```

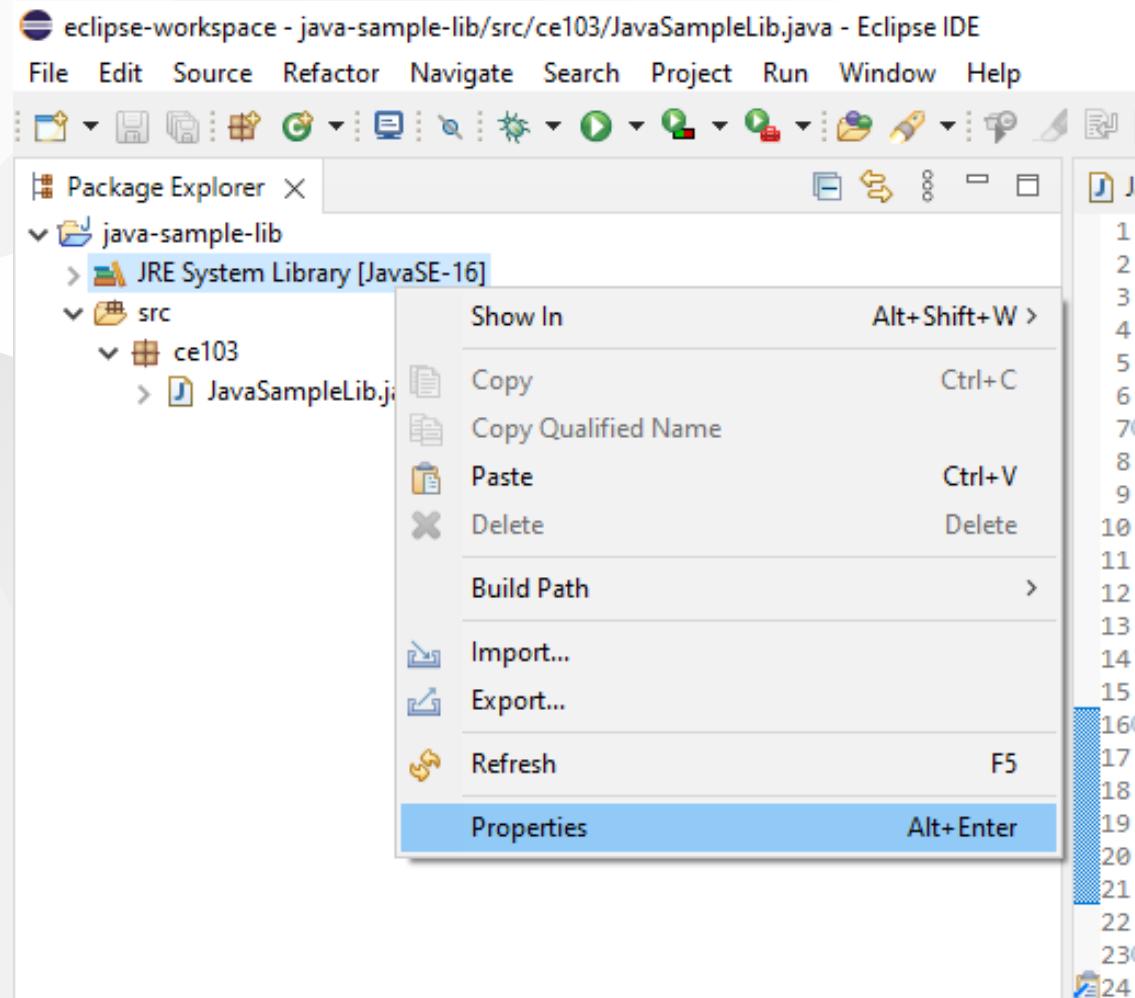

In my case eclipse build JDK is newer than that I installed and set for my OS

If we check version we can see problem Java version 1.8.0\_231

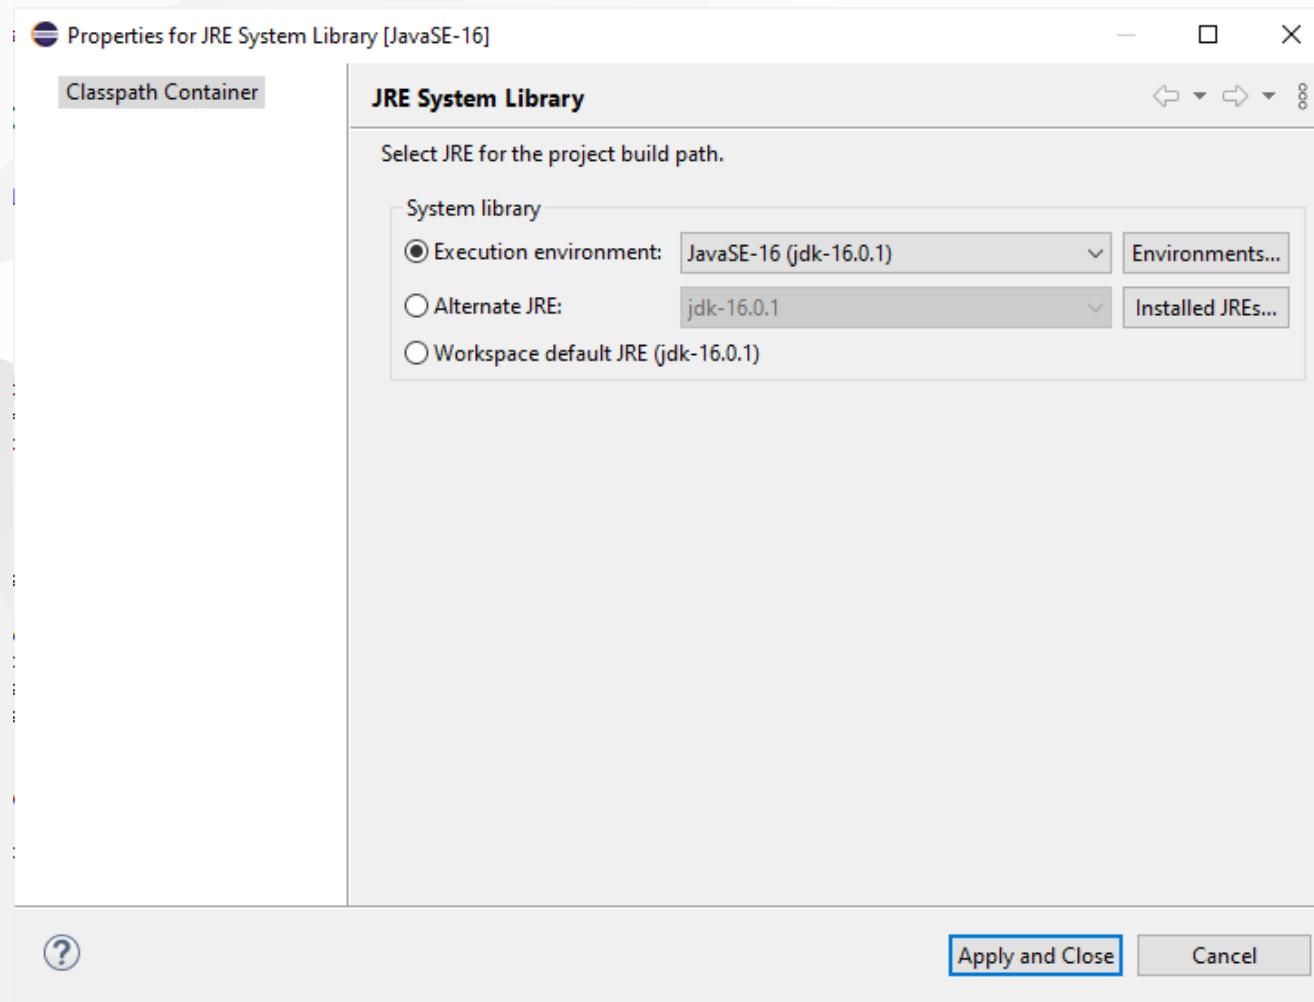

```
C:\Users\ugur.coruh\Desktop\java-export-sample>java -showversion
java version "1.8.0_231"
Java(TM) SE Runtime Environment (build 1.8.0_231-b11)
Java HotSpot(TM) 64-Bit Server VM (build 25.231-b11, mixed mode)

Usage: java [-options] class [args...]
```

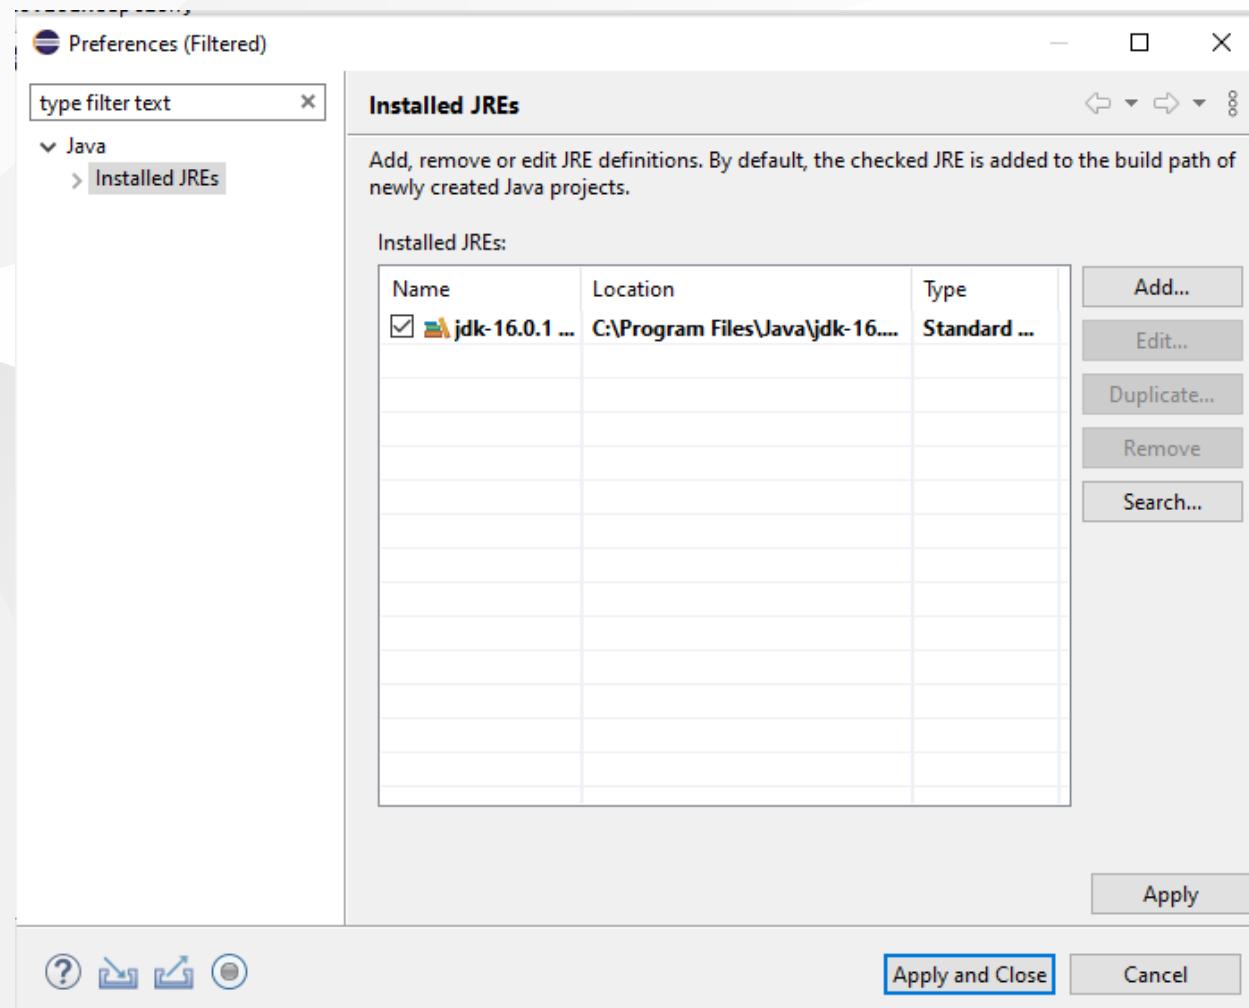

We can found installed and builded JDK for our application from Eclipse setting

## select environments

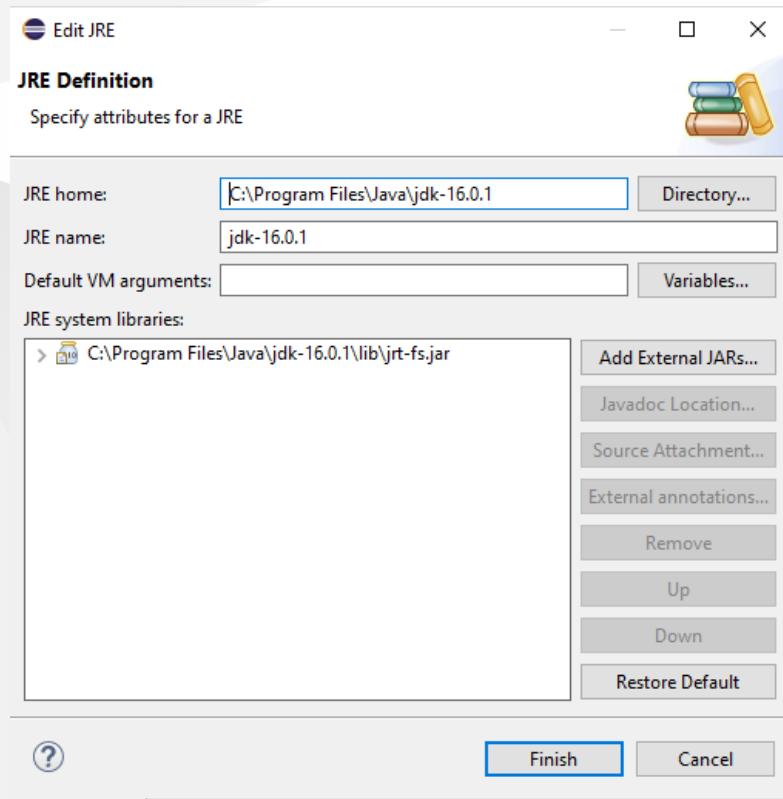

## select installed JRE or JDK

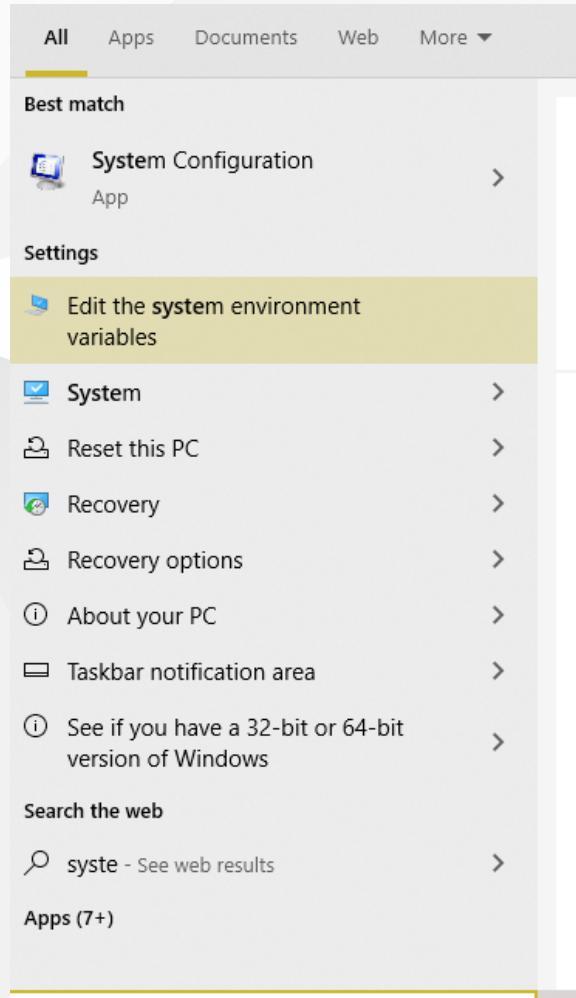

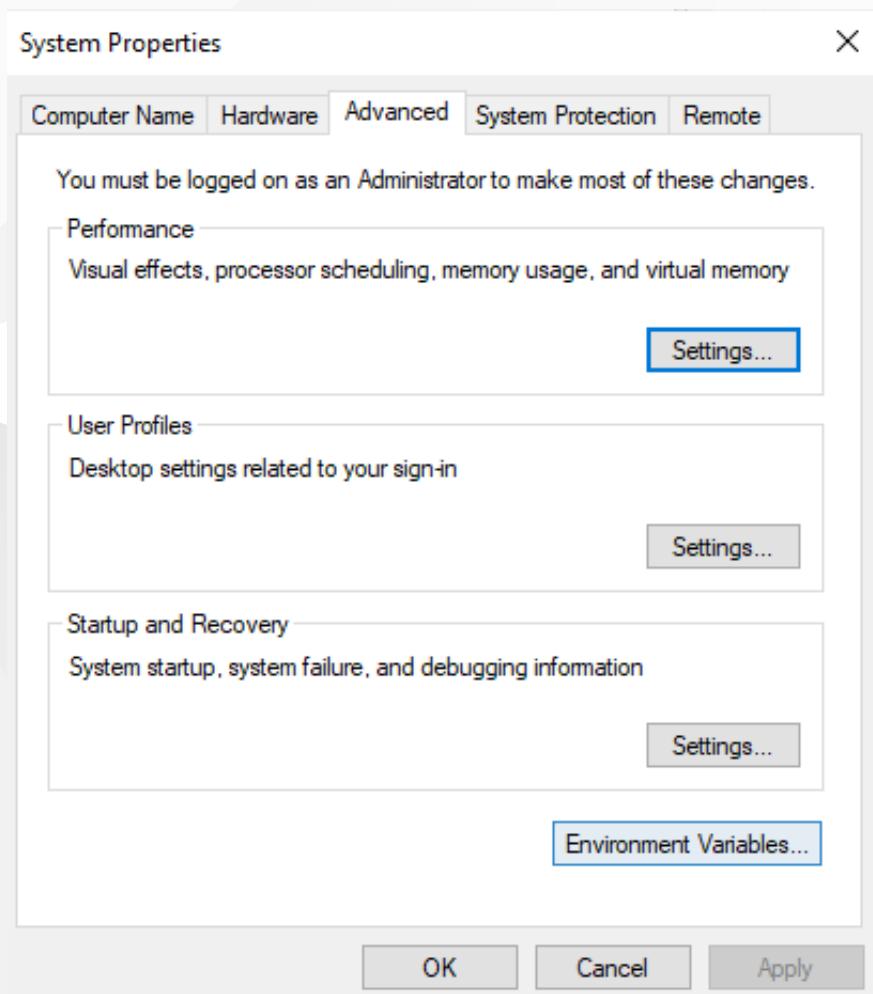

you can see installed JRE or JDK home

C:\Program Files\Java\jdk-16.0.1

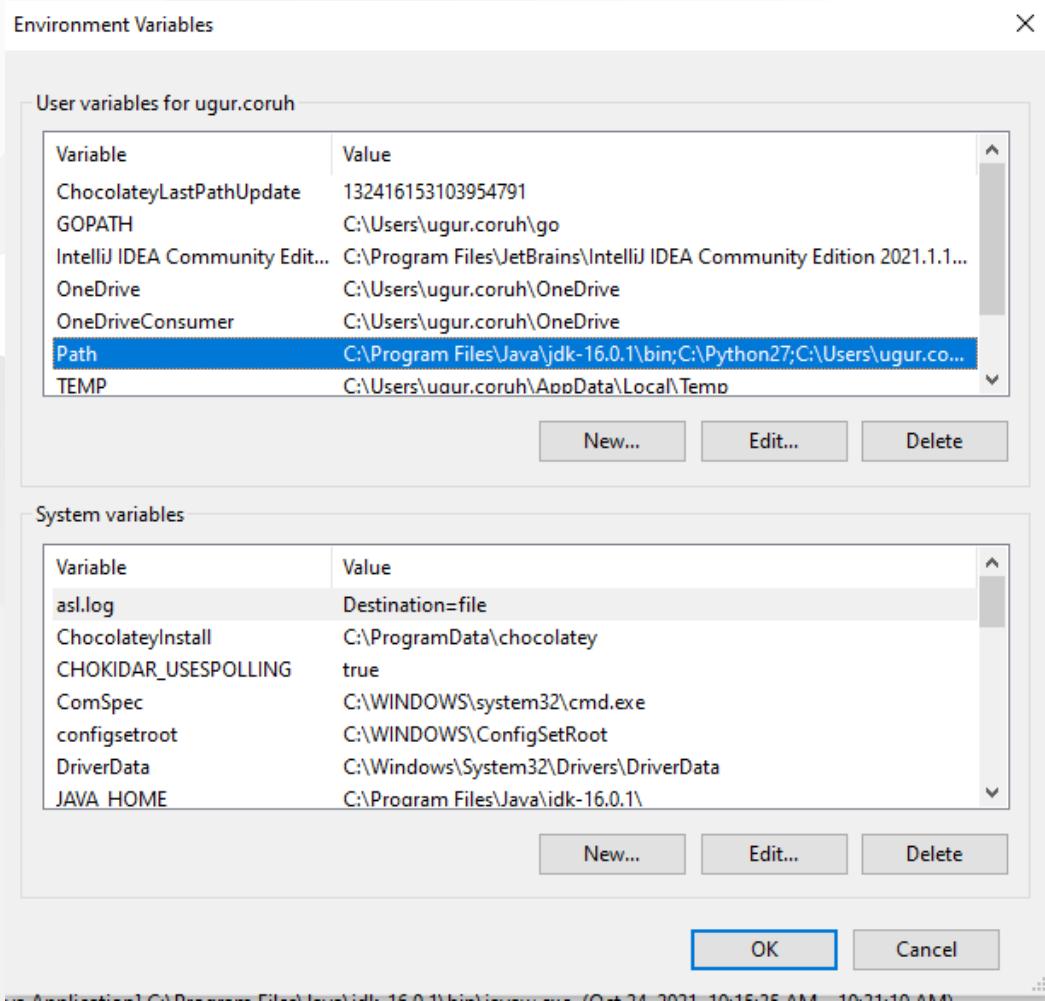

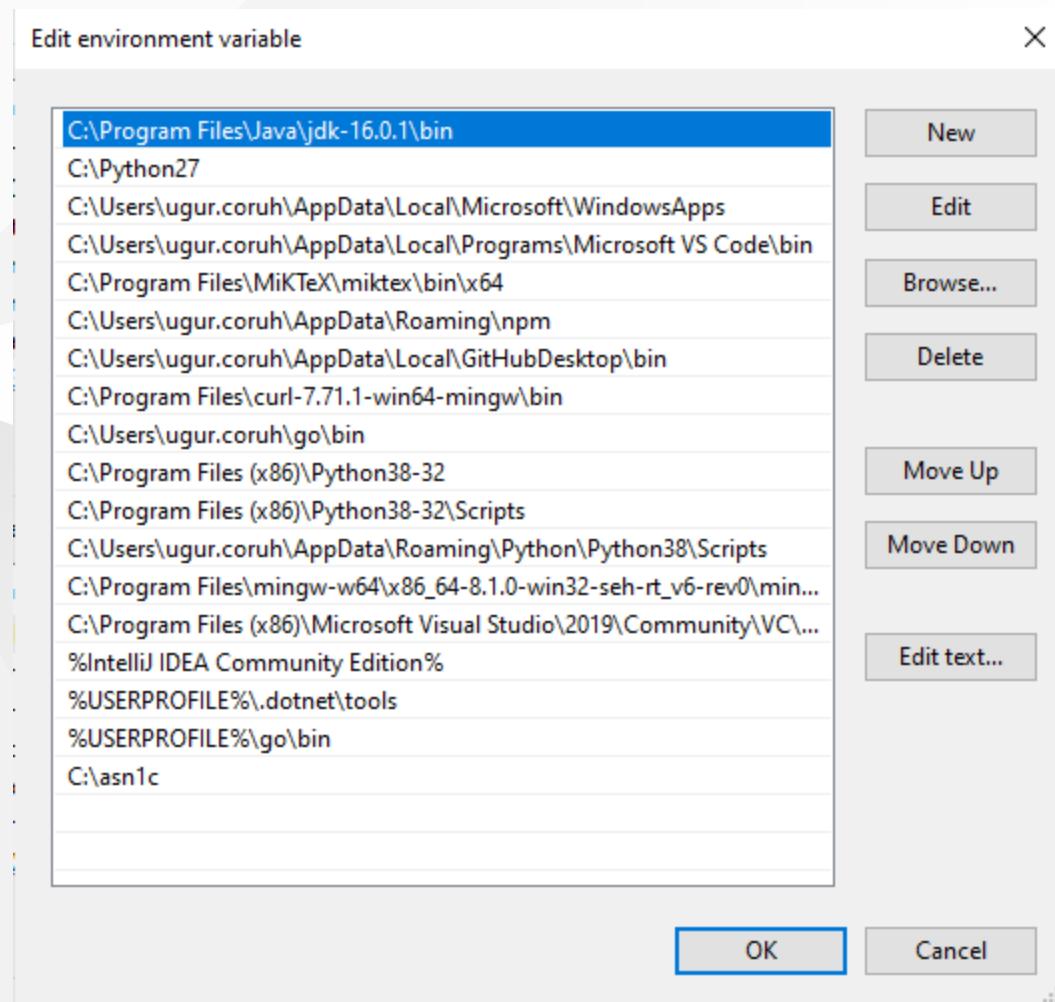

## Open system environment to fix this problem

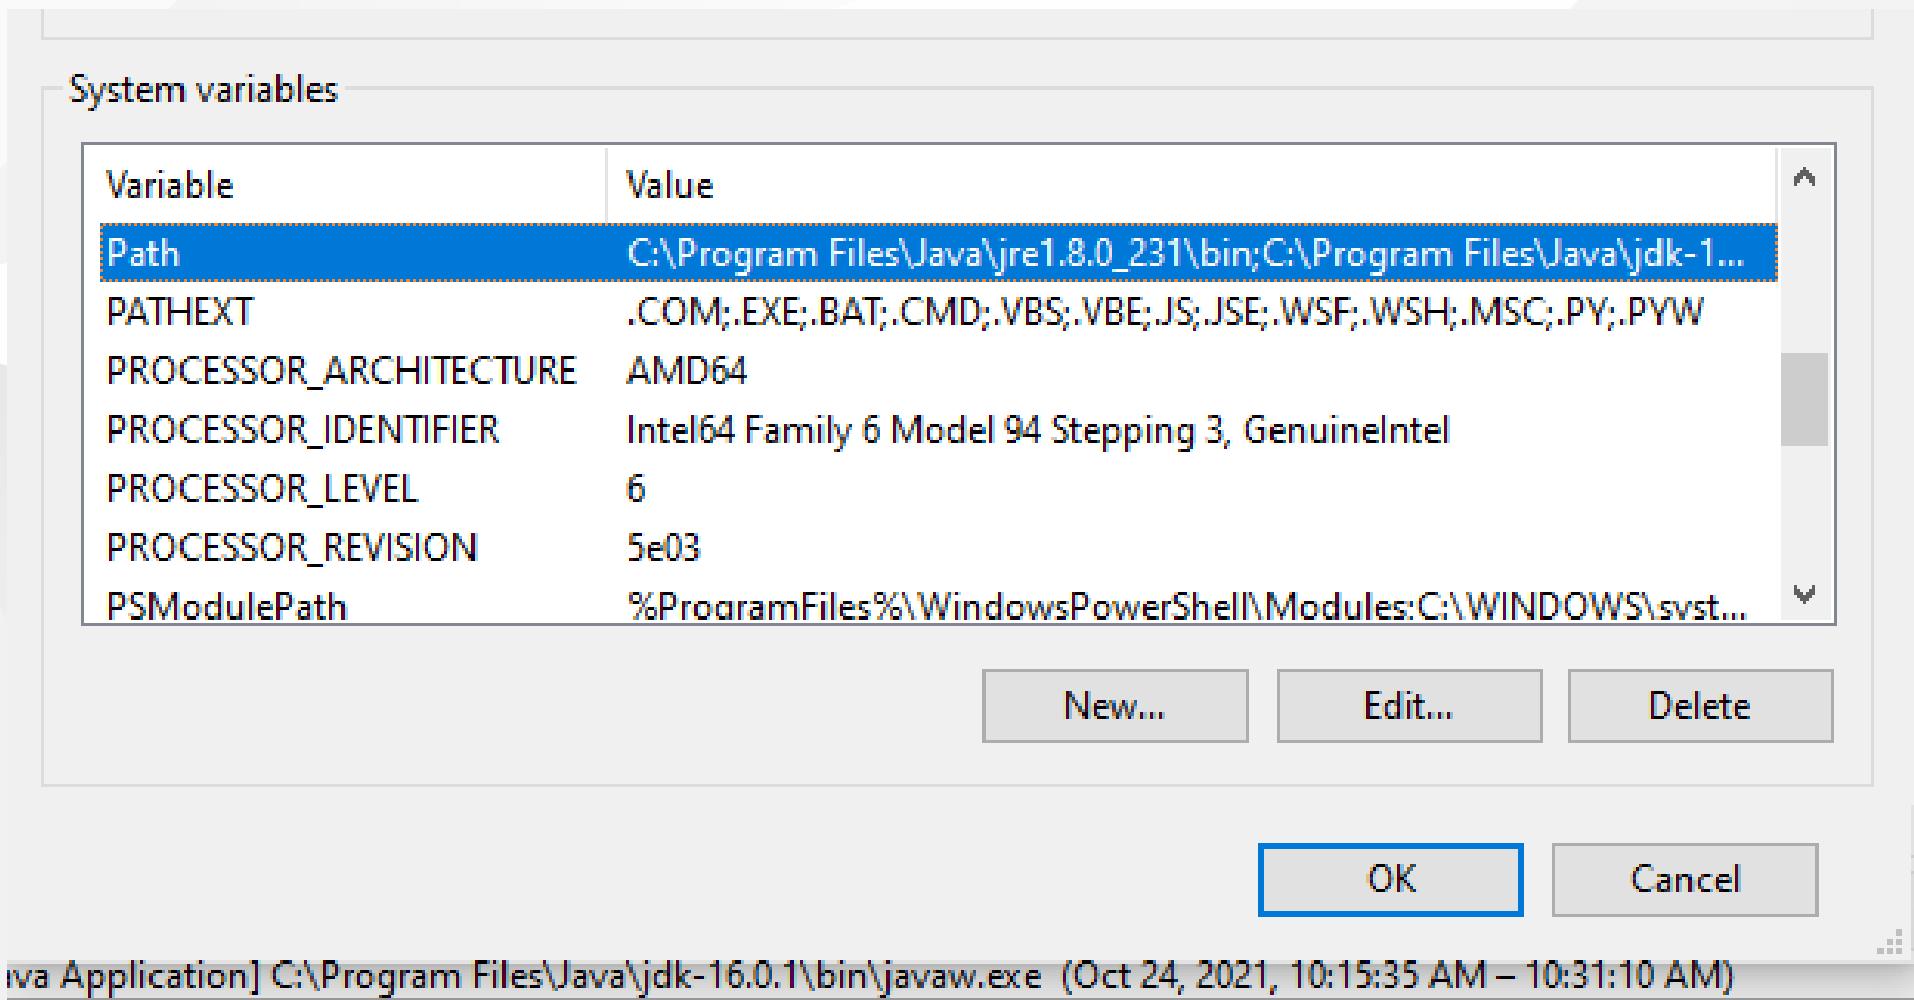

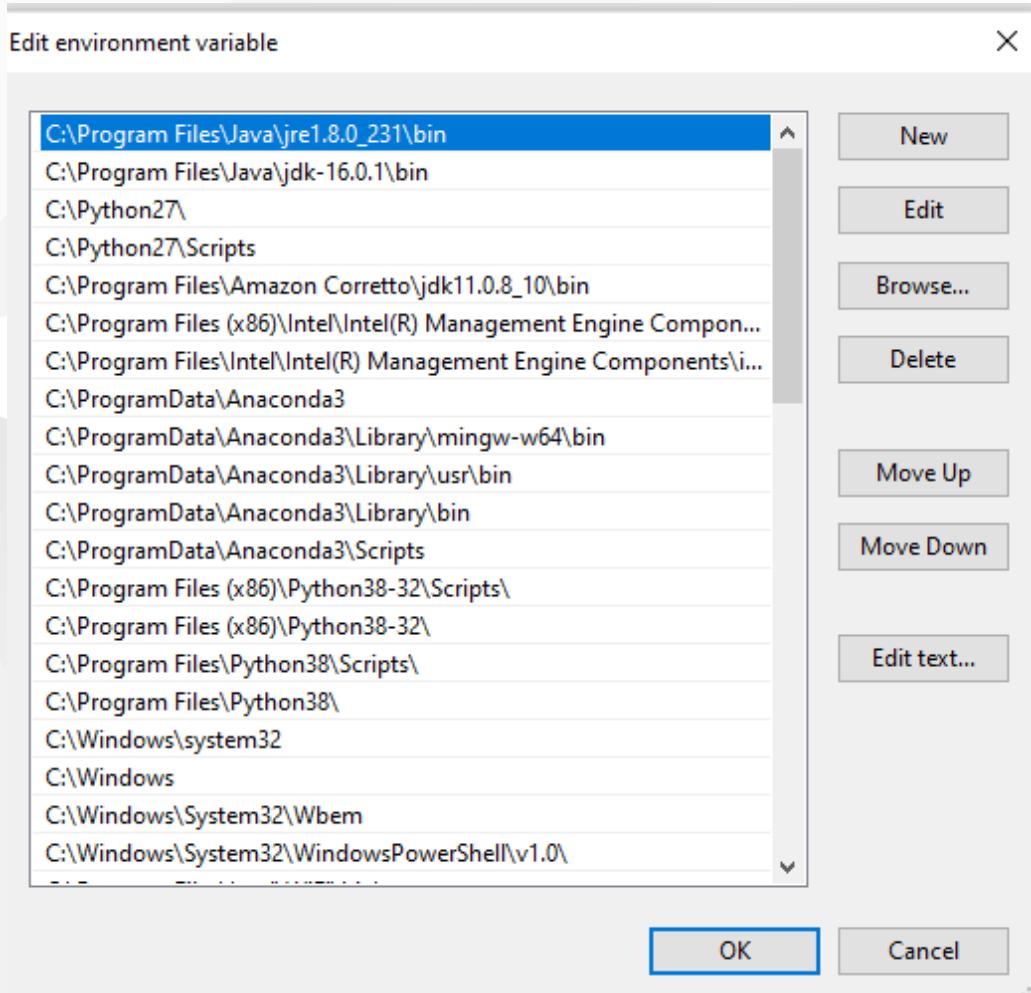

## Check user settings first

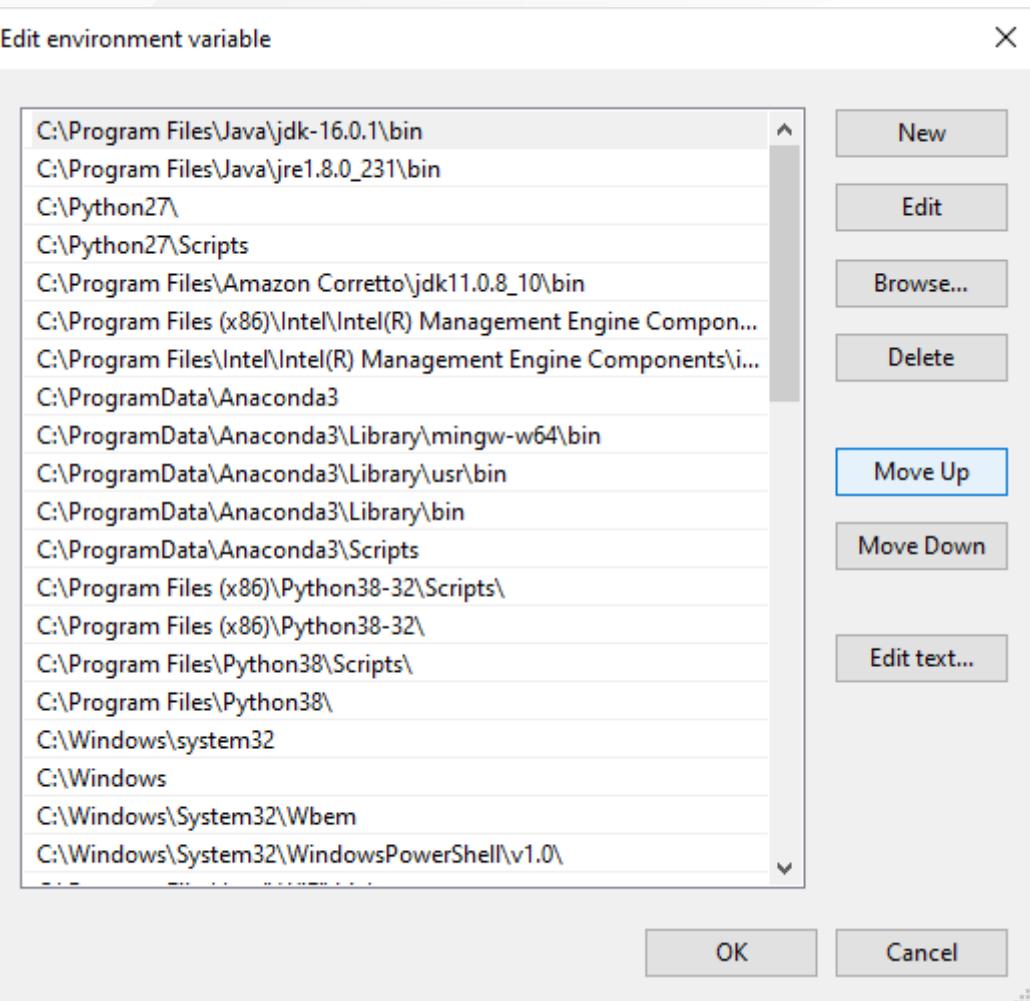

## Check system settings

we will move up the JDK 16 configuration then command line will run first java

Also in system setting check JAVA\_HOME

## System variables

Variable	Value
JAVA_HOME	C:\Program Files\Java\jdk-16.0.1\
MOSQUITTO_DIR	C:\Program Files\mosquitto
NUMBER_OF_PROCESSORS	8
OS	Windows NT

After this settings close current command line and open new one

Introduction to Code Reusability and Automate Testing

write

```
java --version
```

if you see java version updated and 16.0.1 then settings are correct

```
C:\WINDOWS\system32\cmd.exe
Microsoft Windows [Version 10.0.19043.1288]
(c) Microsoft Corporation. All rights reserved.

C:\Users\ugur.coruh>java --version
java 16.0.1 2021-04-20
Java(TM) SE Runtime Environment (build 16.0.1+9-24)
Java HotSpot(TM) 64-Bit Server VM (build 16.0.1+9-24, mixed mode, sharing)

C:\Users\ugur.coruh>
```

and now if we enter and run application as follow we will see output

```
C:\Users\ugur.coruh>cd Desktop  
  
C:\Users\ugur.coruh\Desktop>cd java-export-sample  
  
C:\Users\ugur.coruh\Desktop\java-export-sample>java -jar JavaSampleLibExecutable.jar  
Hello World!  
Hello There  
Results is 9  
Results is 9
```

But when you click this jar its not running as you see so we have options to provide a  
clickable application there

Launch4j is an option here

## Launch4j - Cross-platform Java executable wrapper

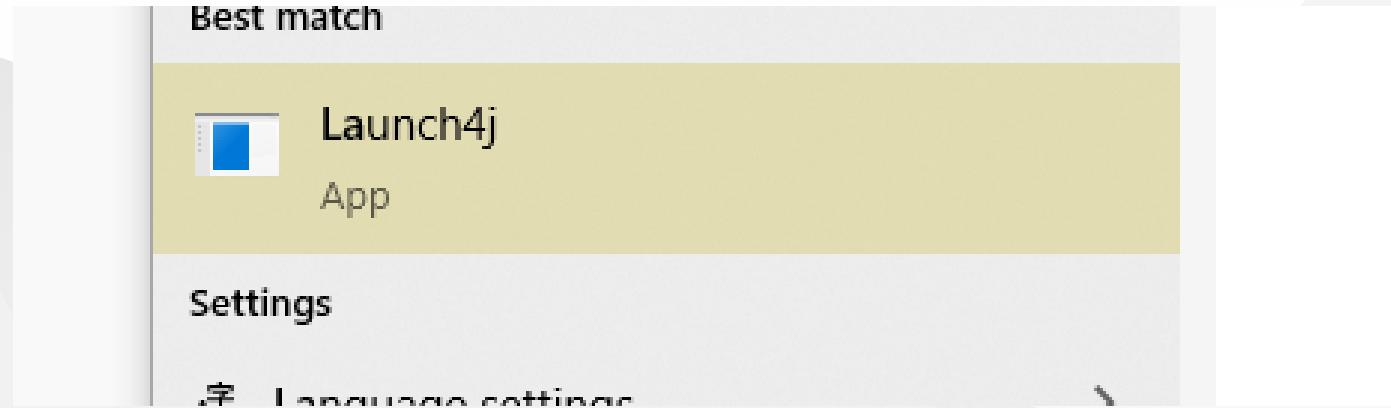

you can watch this tutorial also

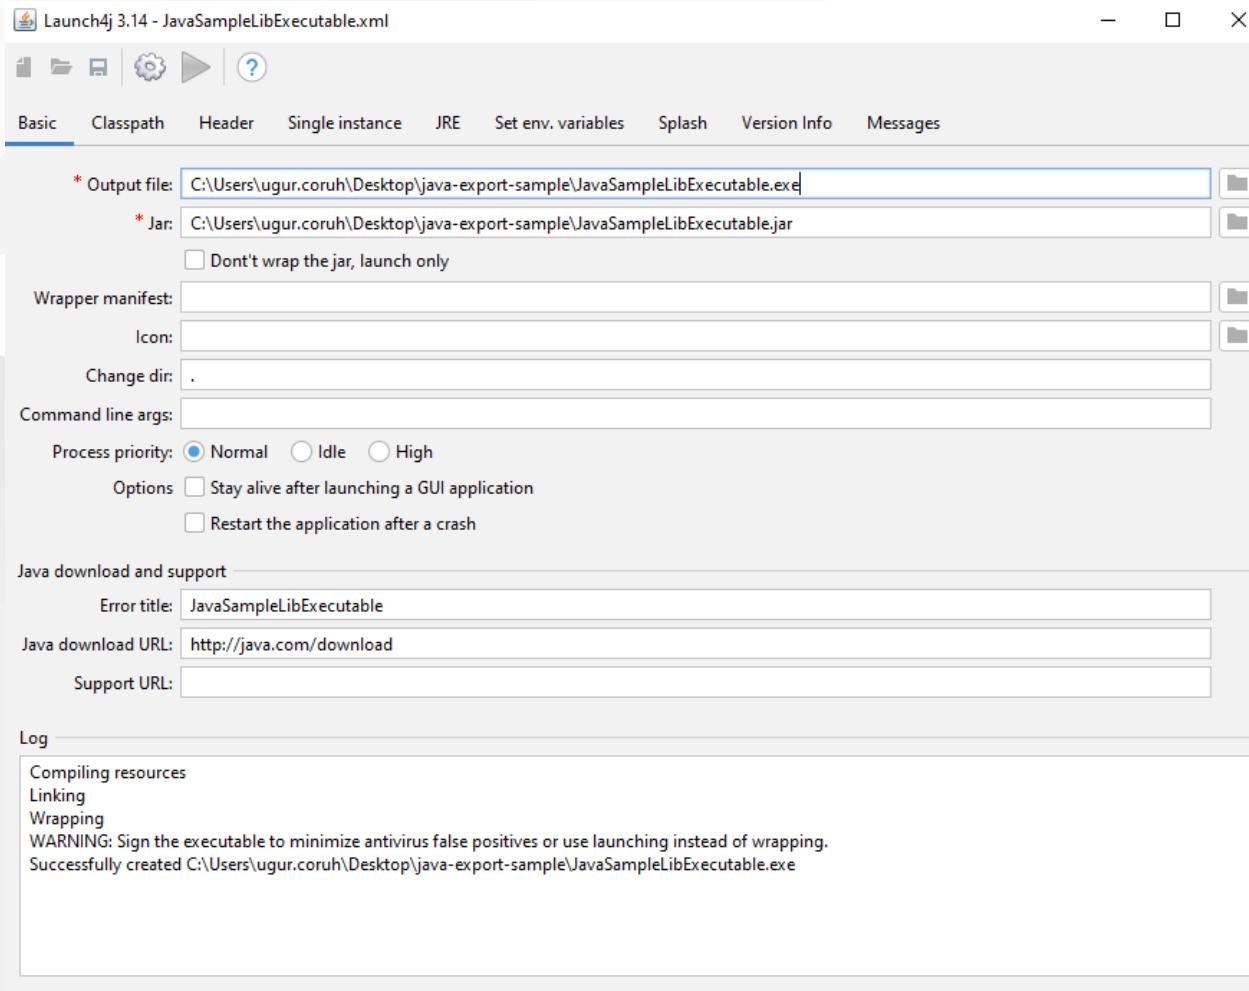

[How to convert jar to exe using Launch4J Full explanation - YouTube](#)

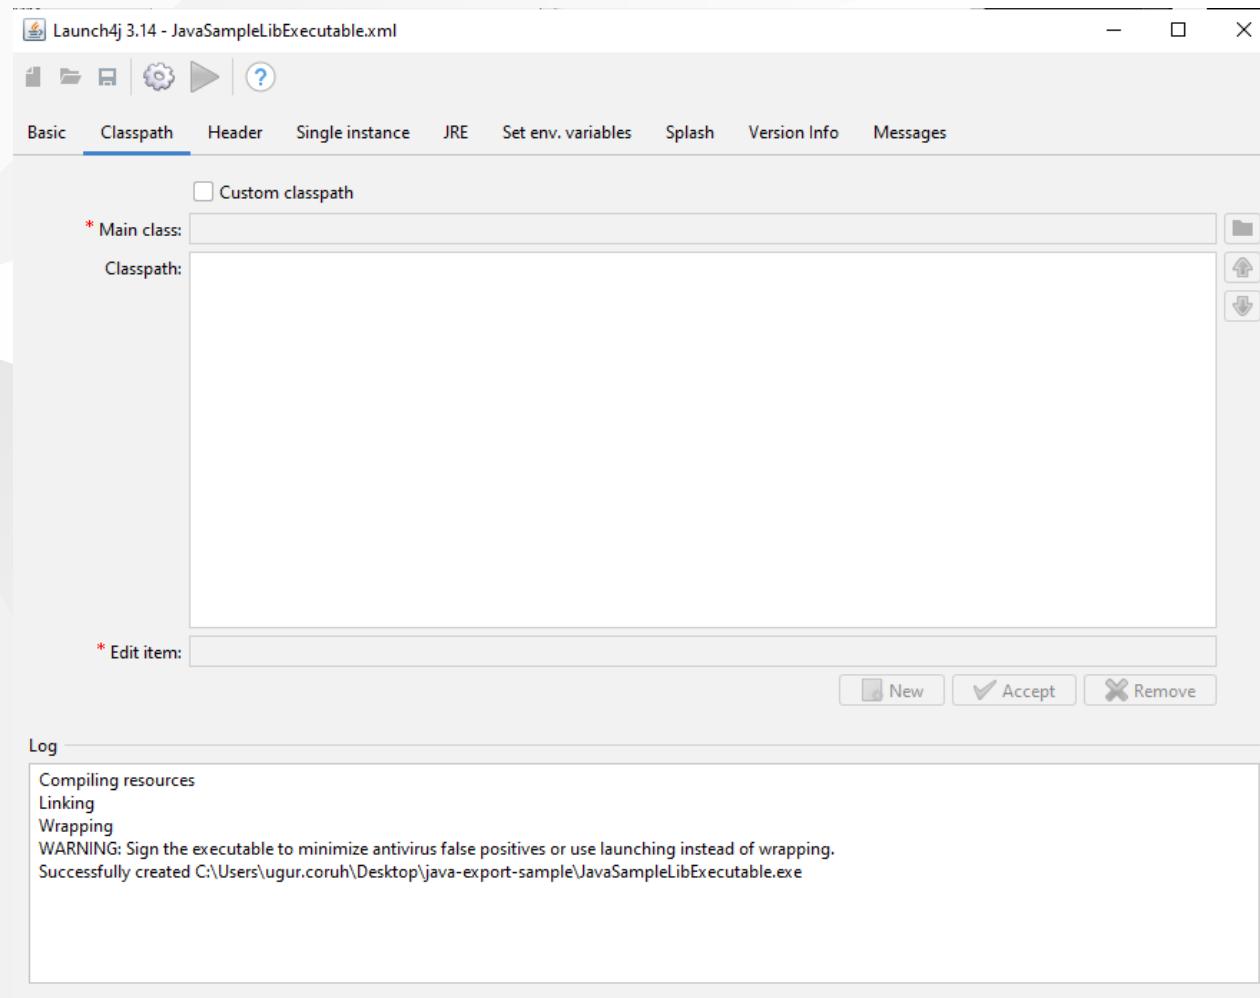

Download and install launch4j and open application

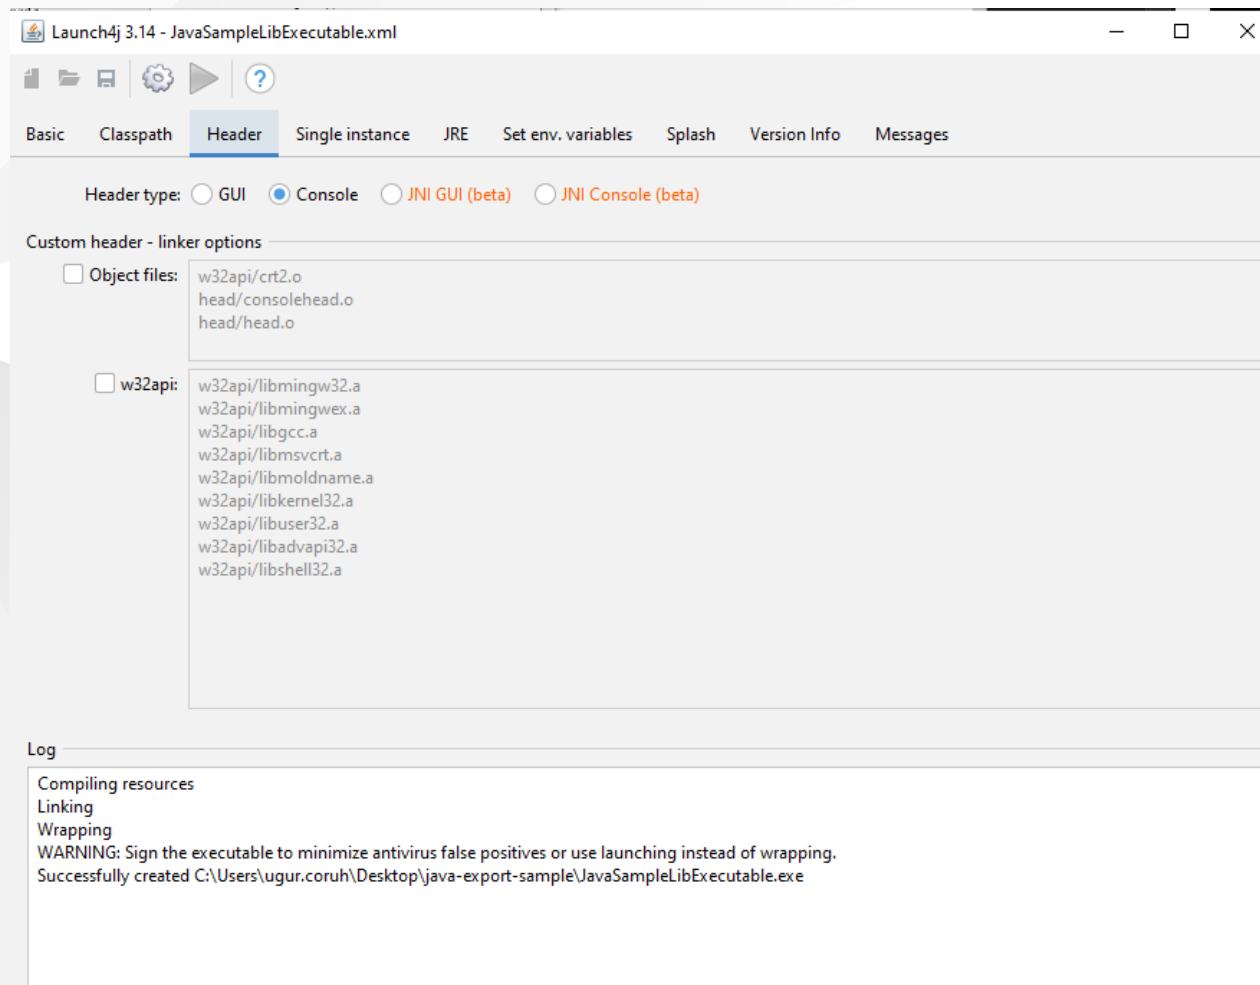

configure your application settings similar to below select jar file and exe output path

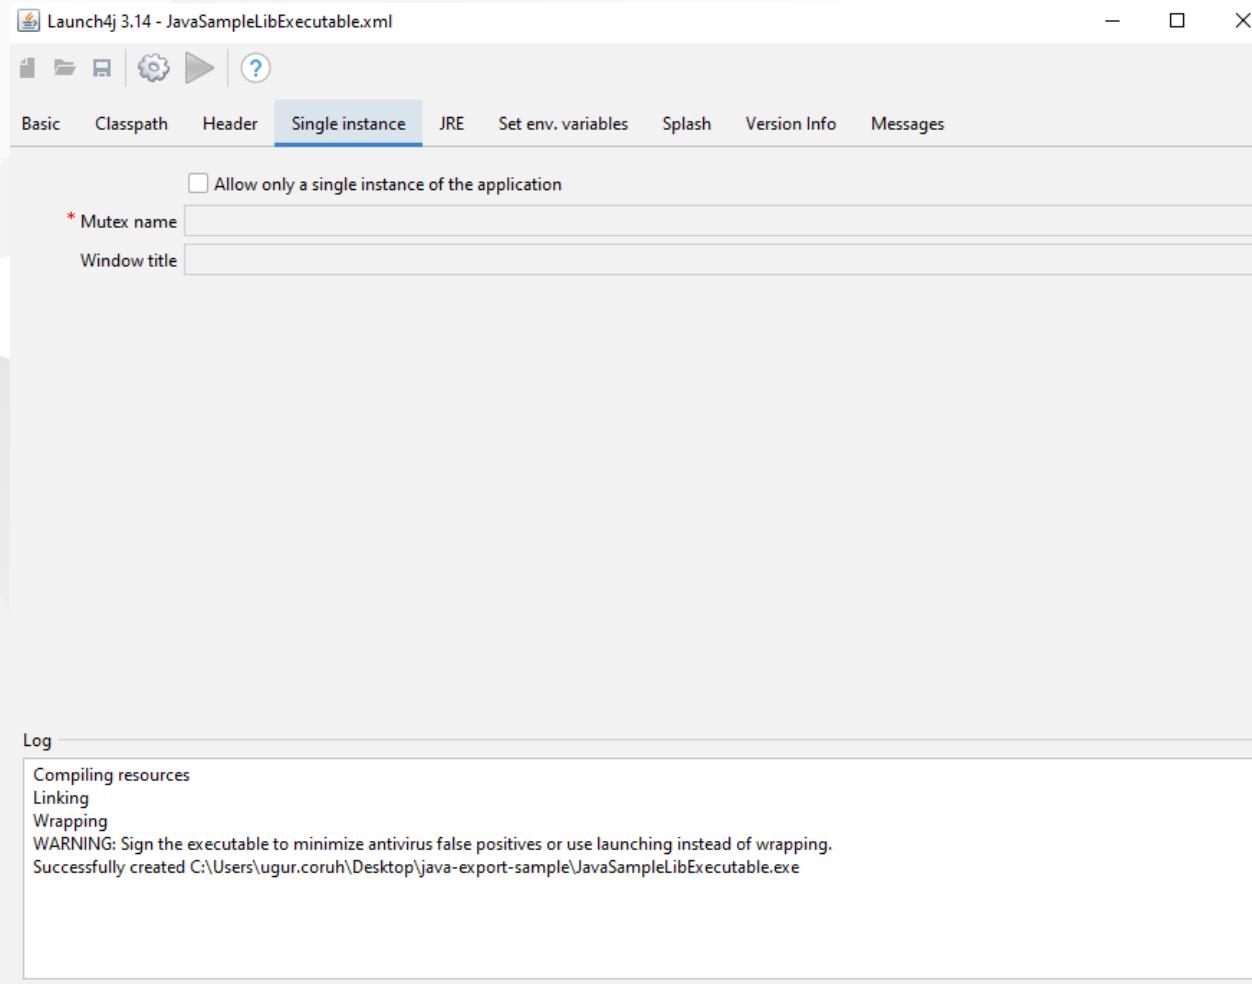

we can customize main class if have multiple main class

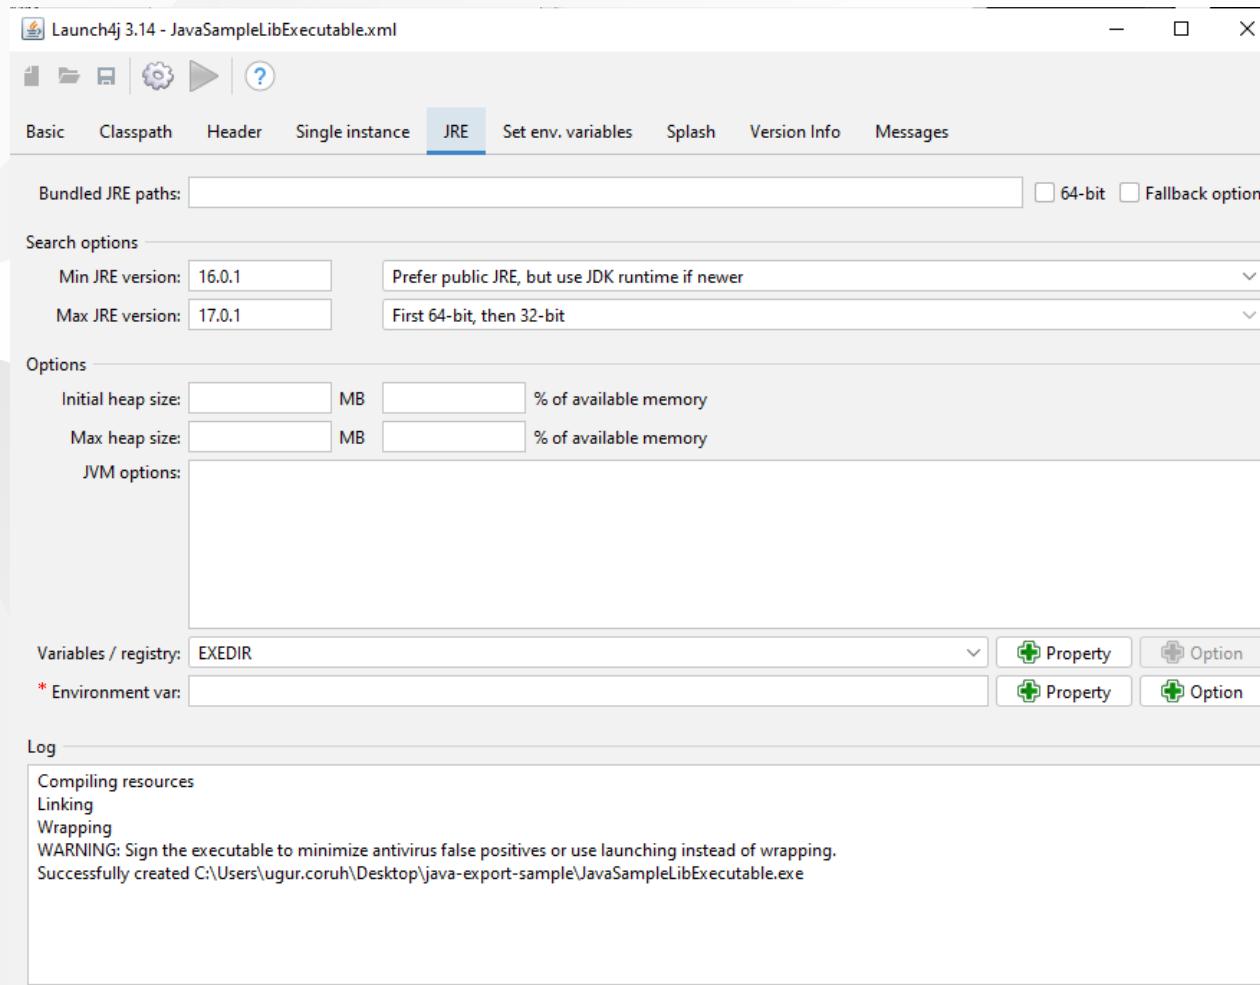

## select console from setting for this application

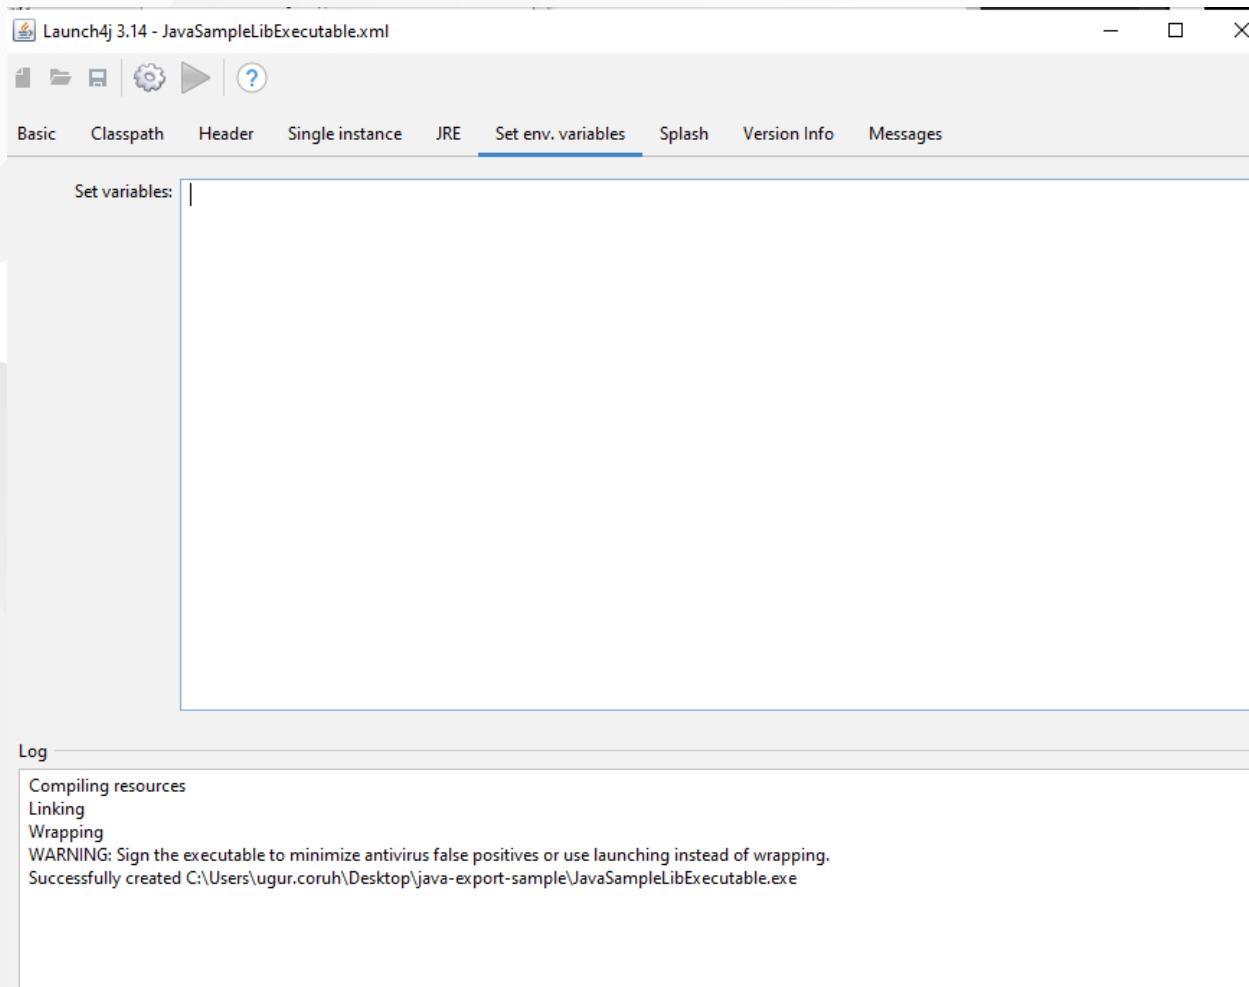

we can provide a single running application, this setting avoid to run multiple instances

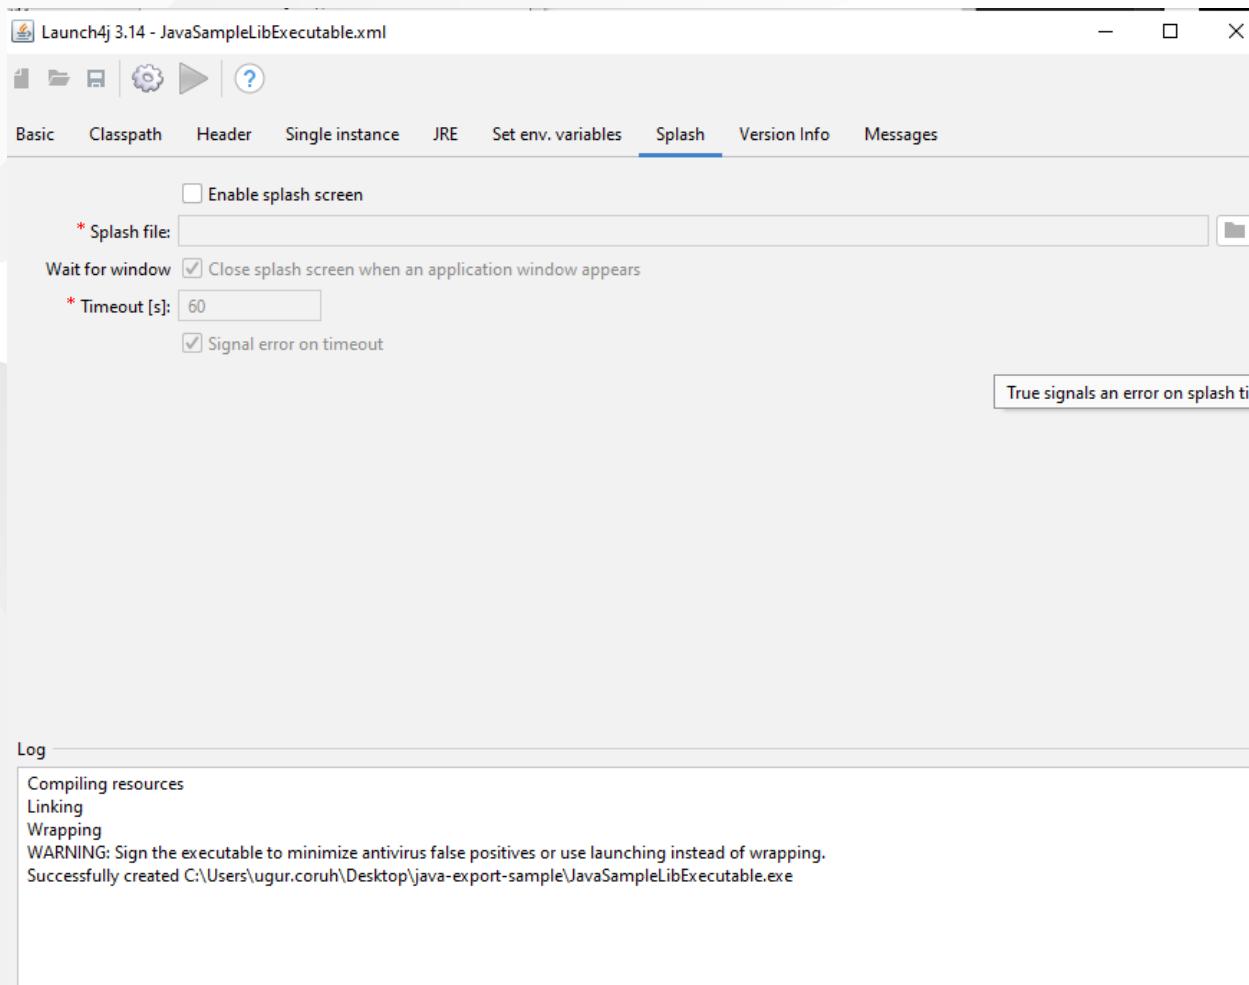

## we need to set runtime environment versions

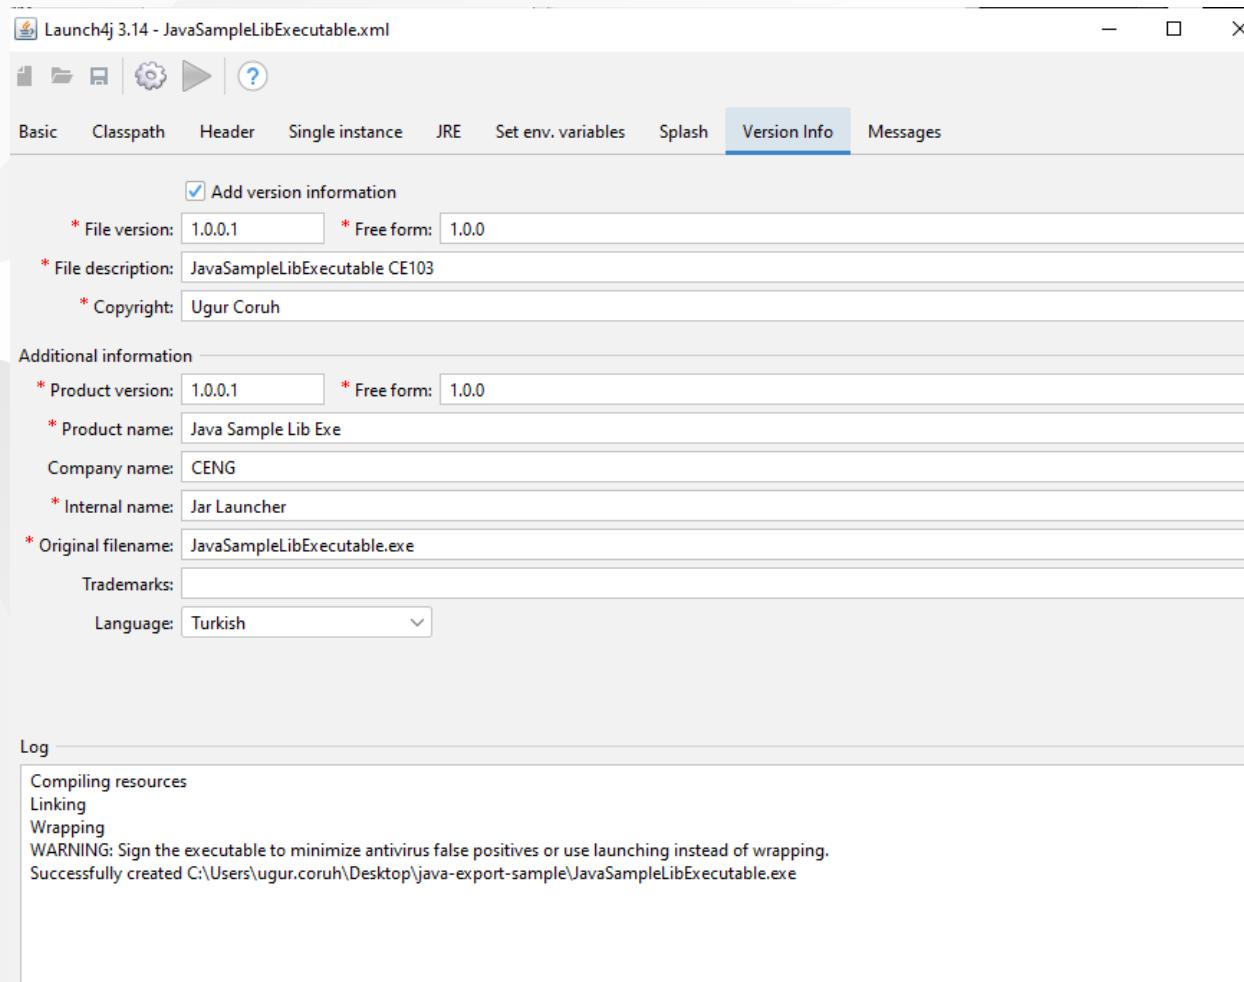

you can set system parameters before running application

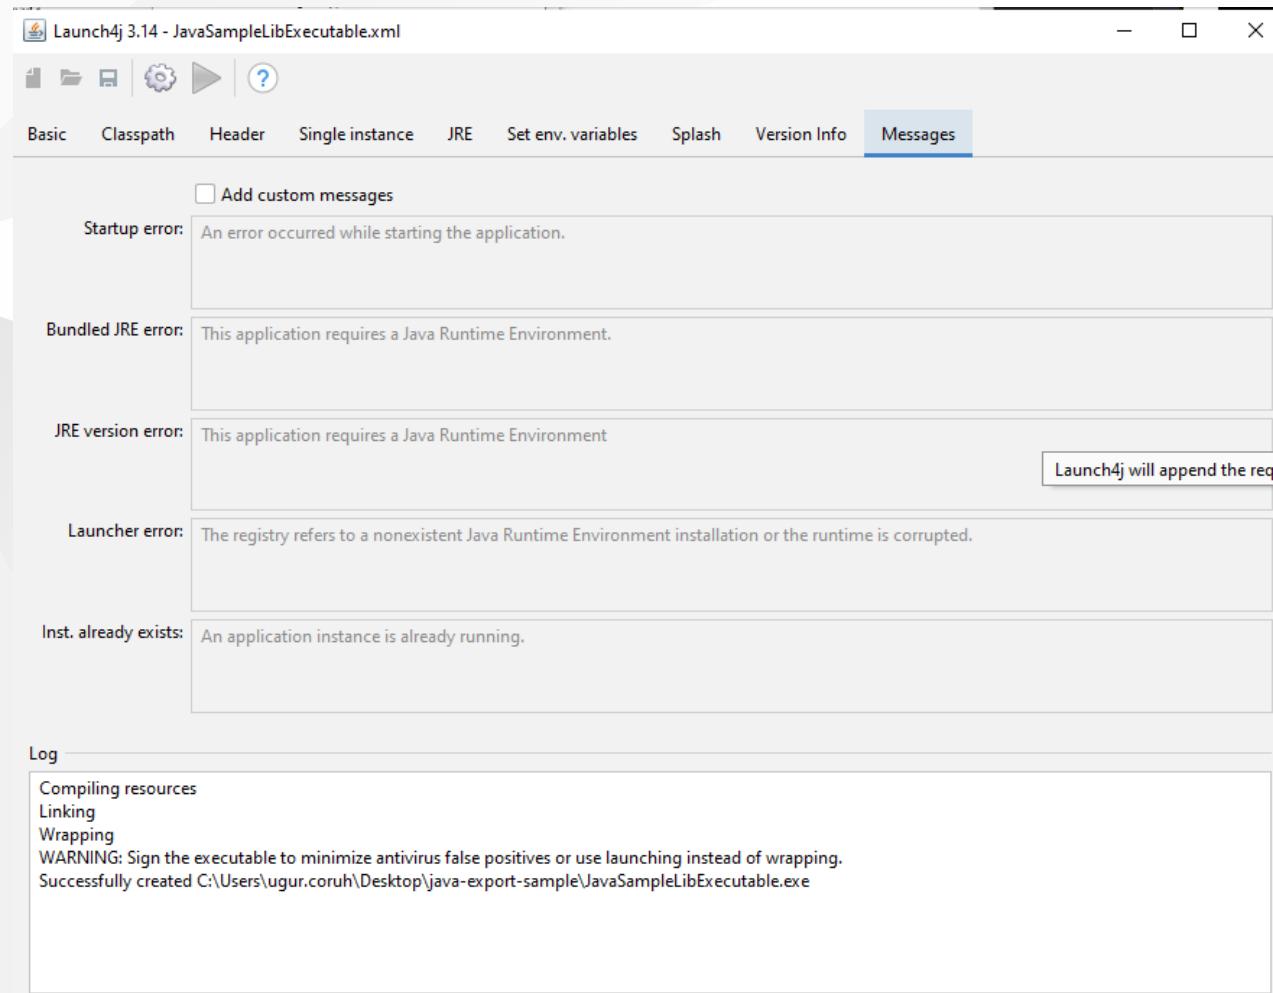

with splash screen you can show a splash screen image for your application

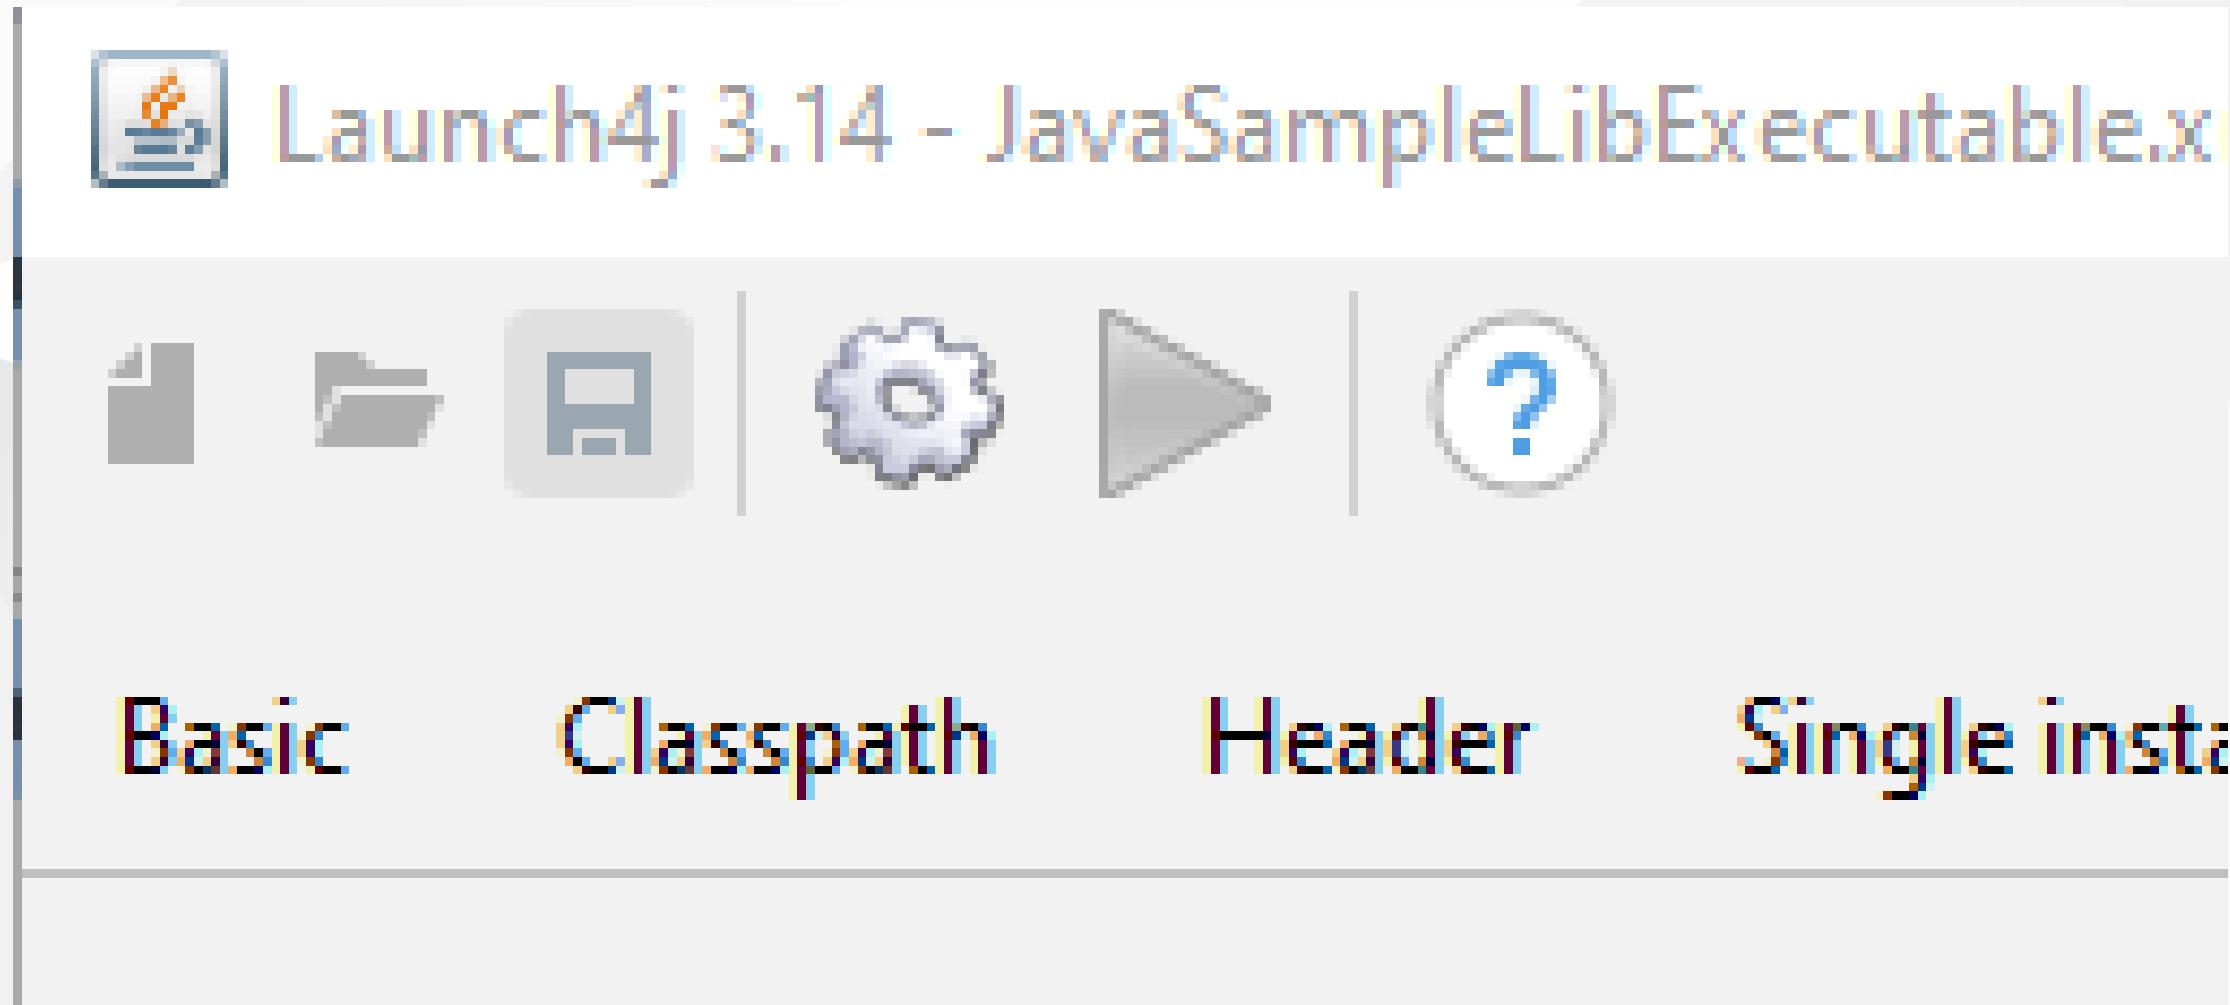

## File attributes such as version product information is configured from version info tab

if your application runtime condition has an error then you can show this customized messages also

with this options save configuration file xml

and compile settings

you will see generated output file in log screen

```
Compiling resources
```

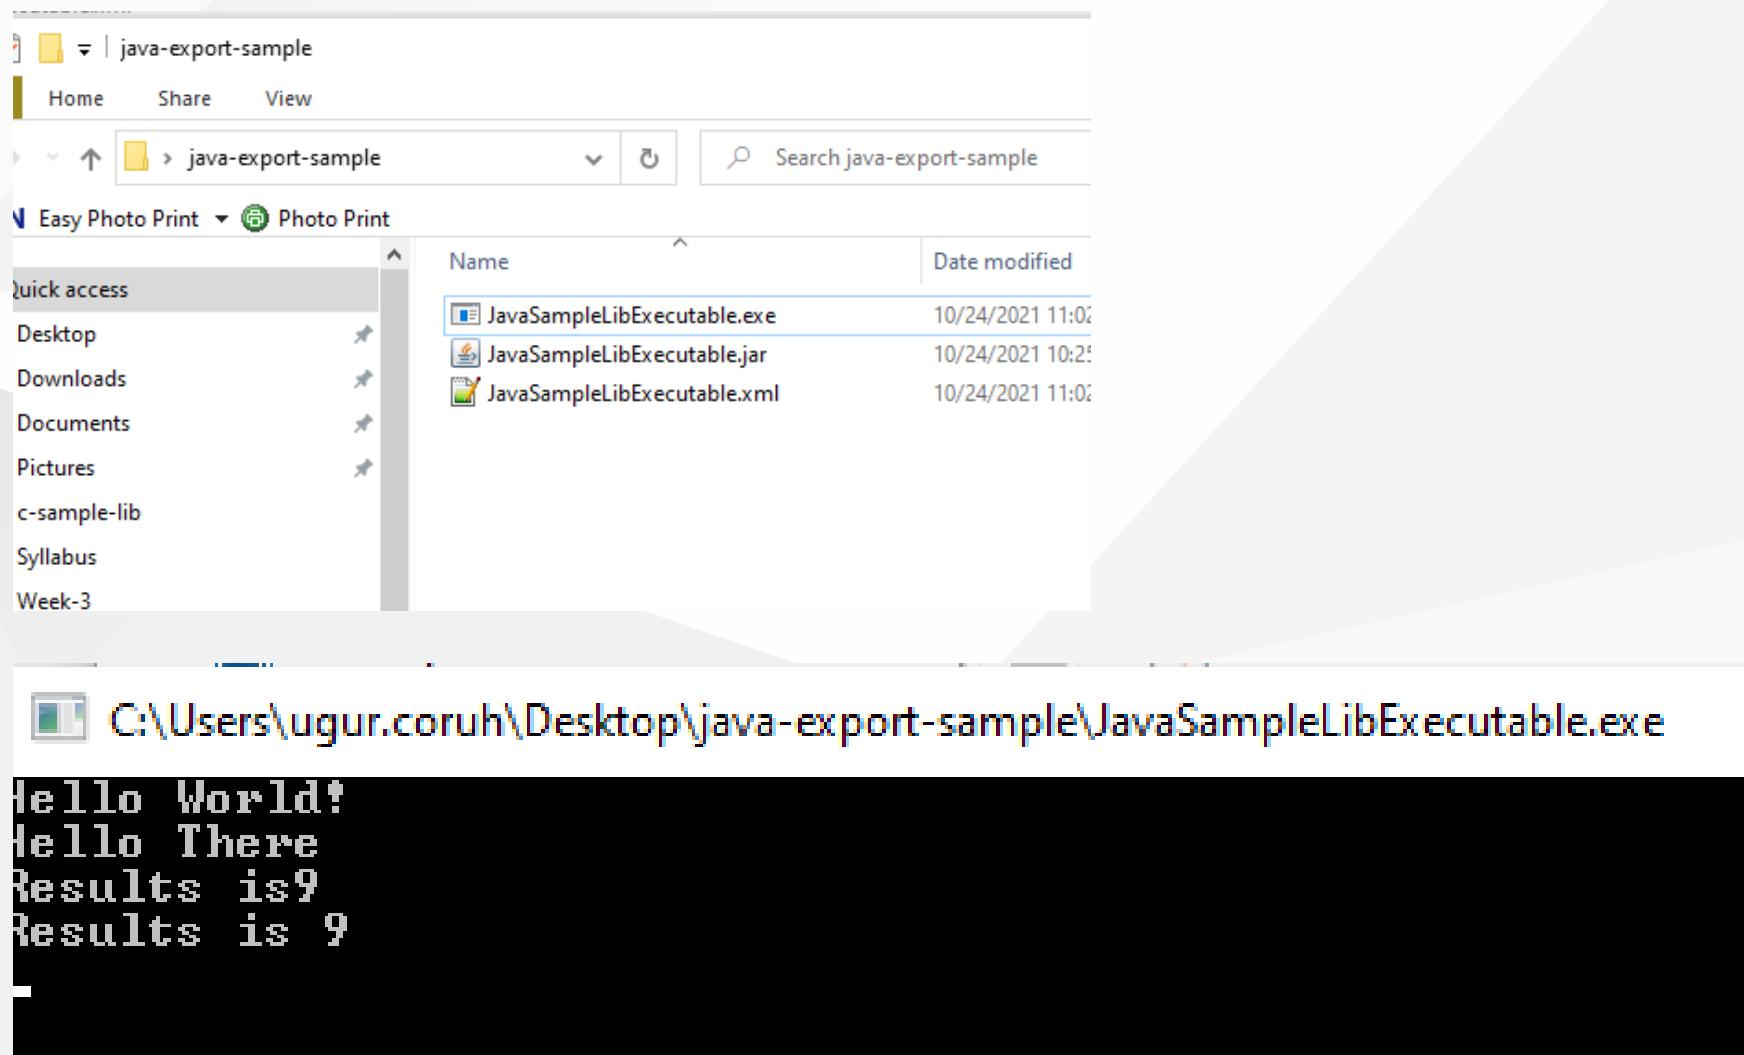

```
Linking
```

```
Wrapping
```

```
WARNING: Sign the executable to minimize antivirus false positives or use launching instead of wrapping.
```

```
Successfully created C:\Users\ugur.coruh\Desktop\java-export-sample\JavaSampleLibExecutable.exe
```

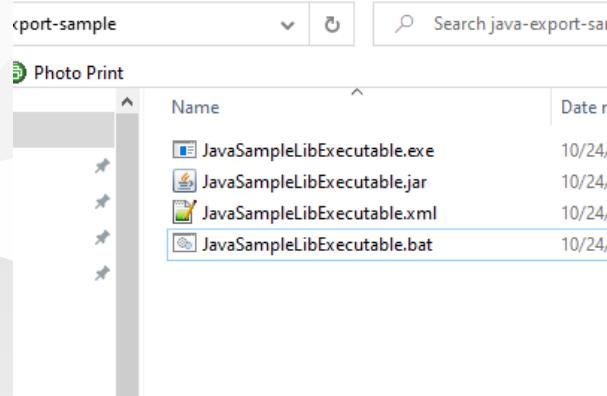

now we can run exe by click

another option here adding a bat file to run current jar file

## JavaSampleLibExecutable.bat

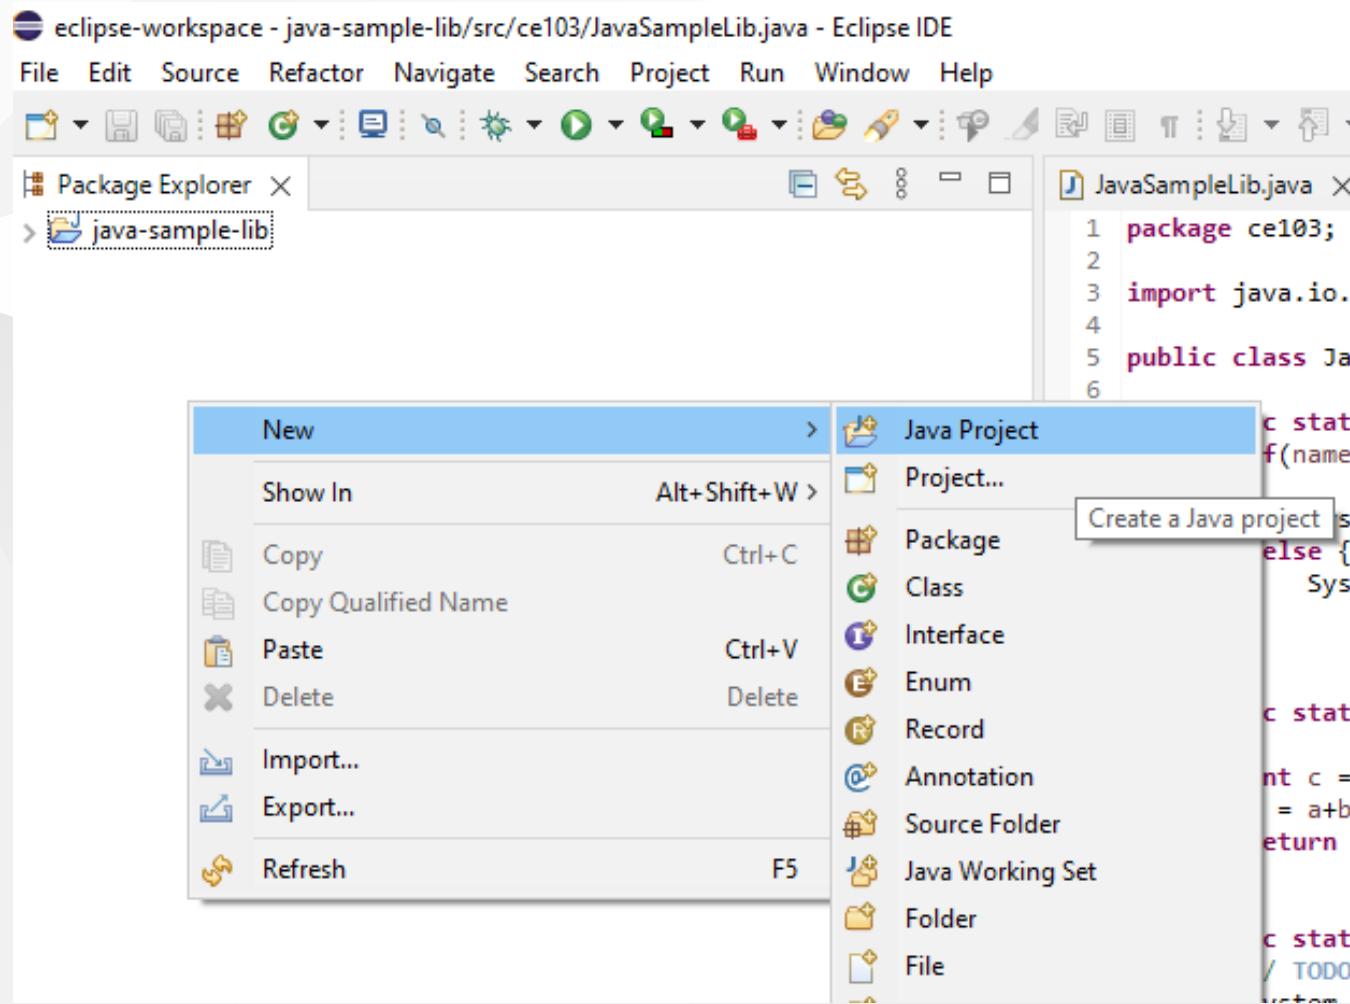

```
java -jar JavaSampleLibExecutable.jar
```

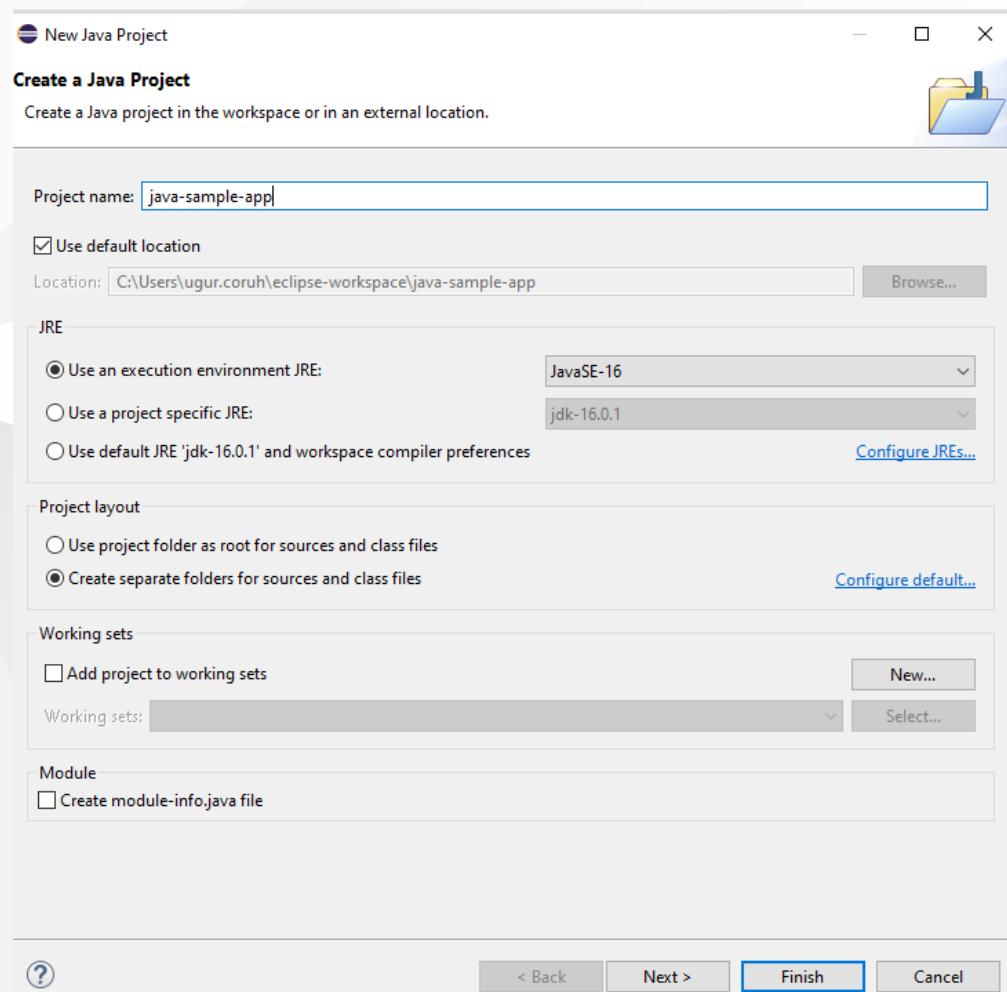

if we click bat file then we will automate command line task for current jar file

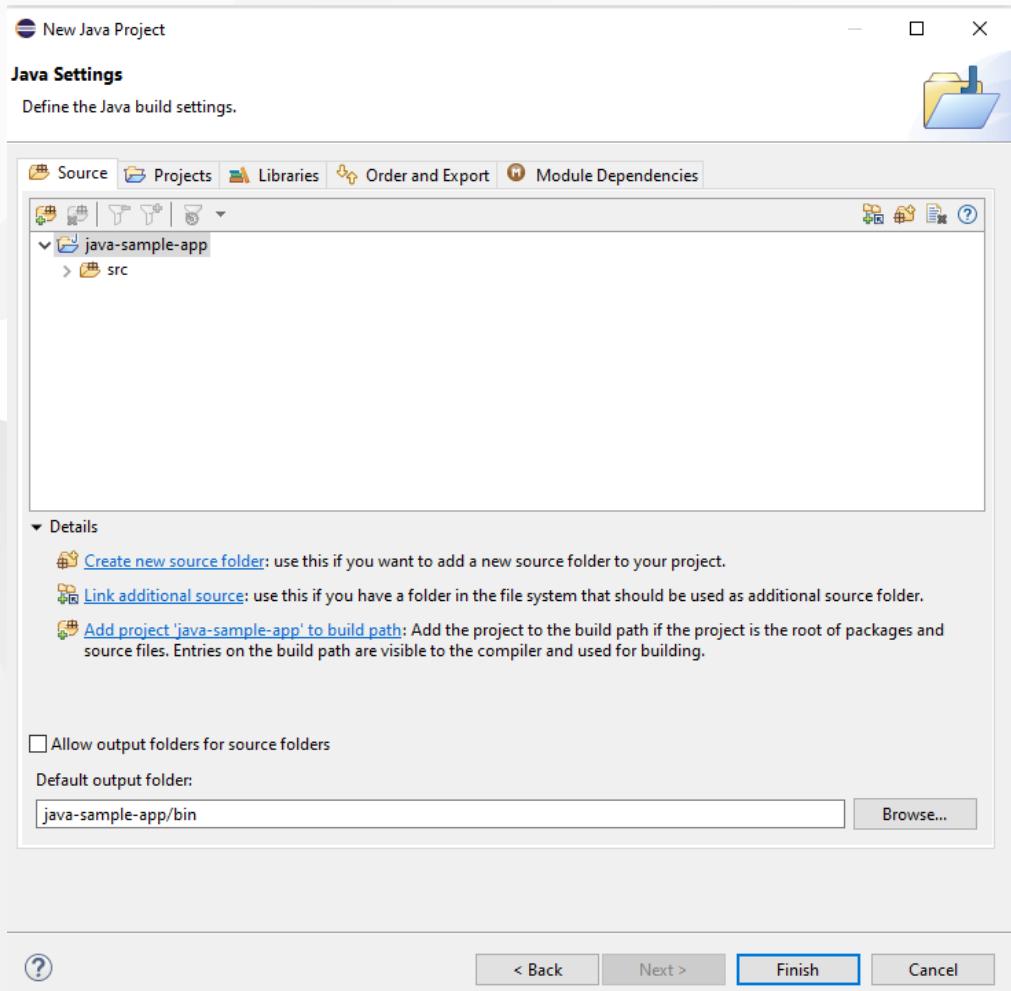

```
C:\WINDOWS\system32\cmd.exe
C:\Users\ugur.coruh\Desktop\java-export-sample>java -jar JavaSampleLibExecutable.jar
Hello World!
Hello There
Results is 9
Results is 9
```

Now return back to our java library and create another console application that use library functions

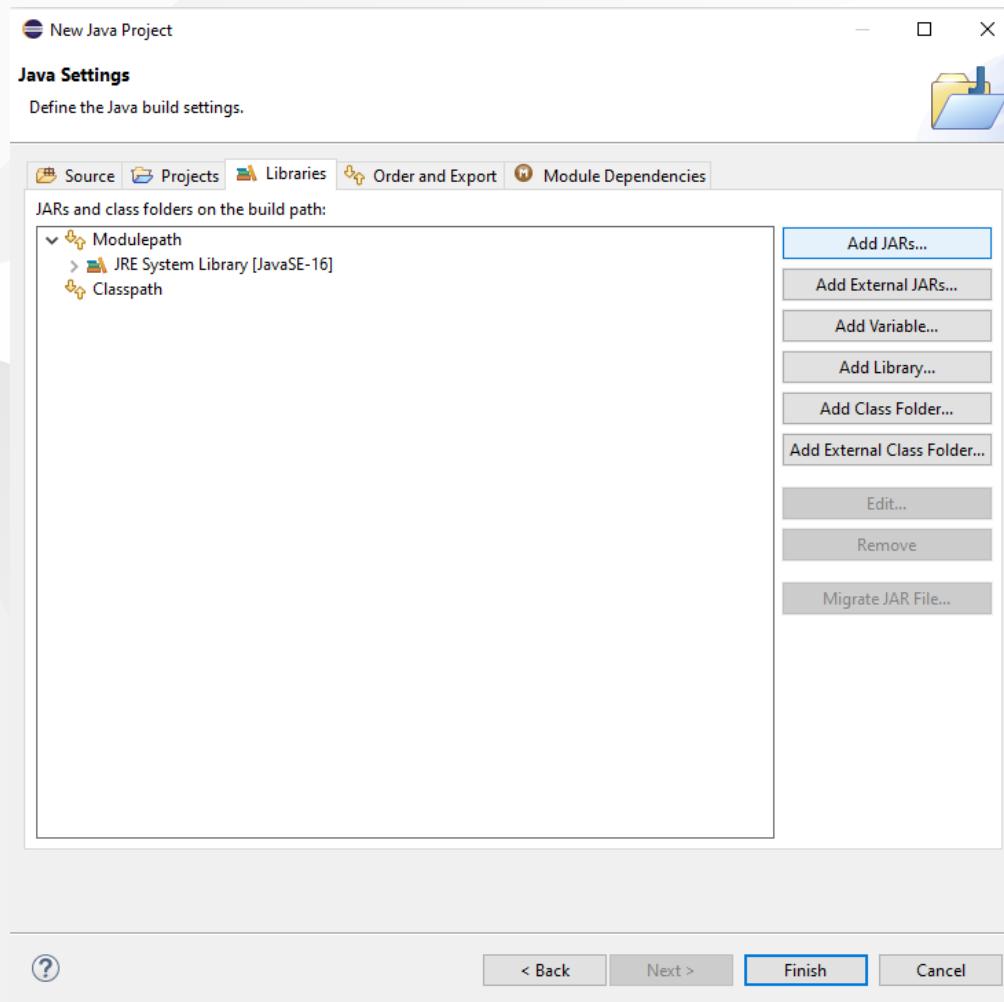

# Introduction to Code Reusability and Automate Testing

you can set libraries in this step from but our library should exported for our solution

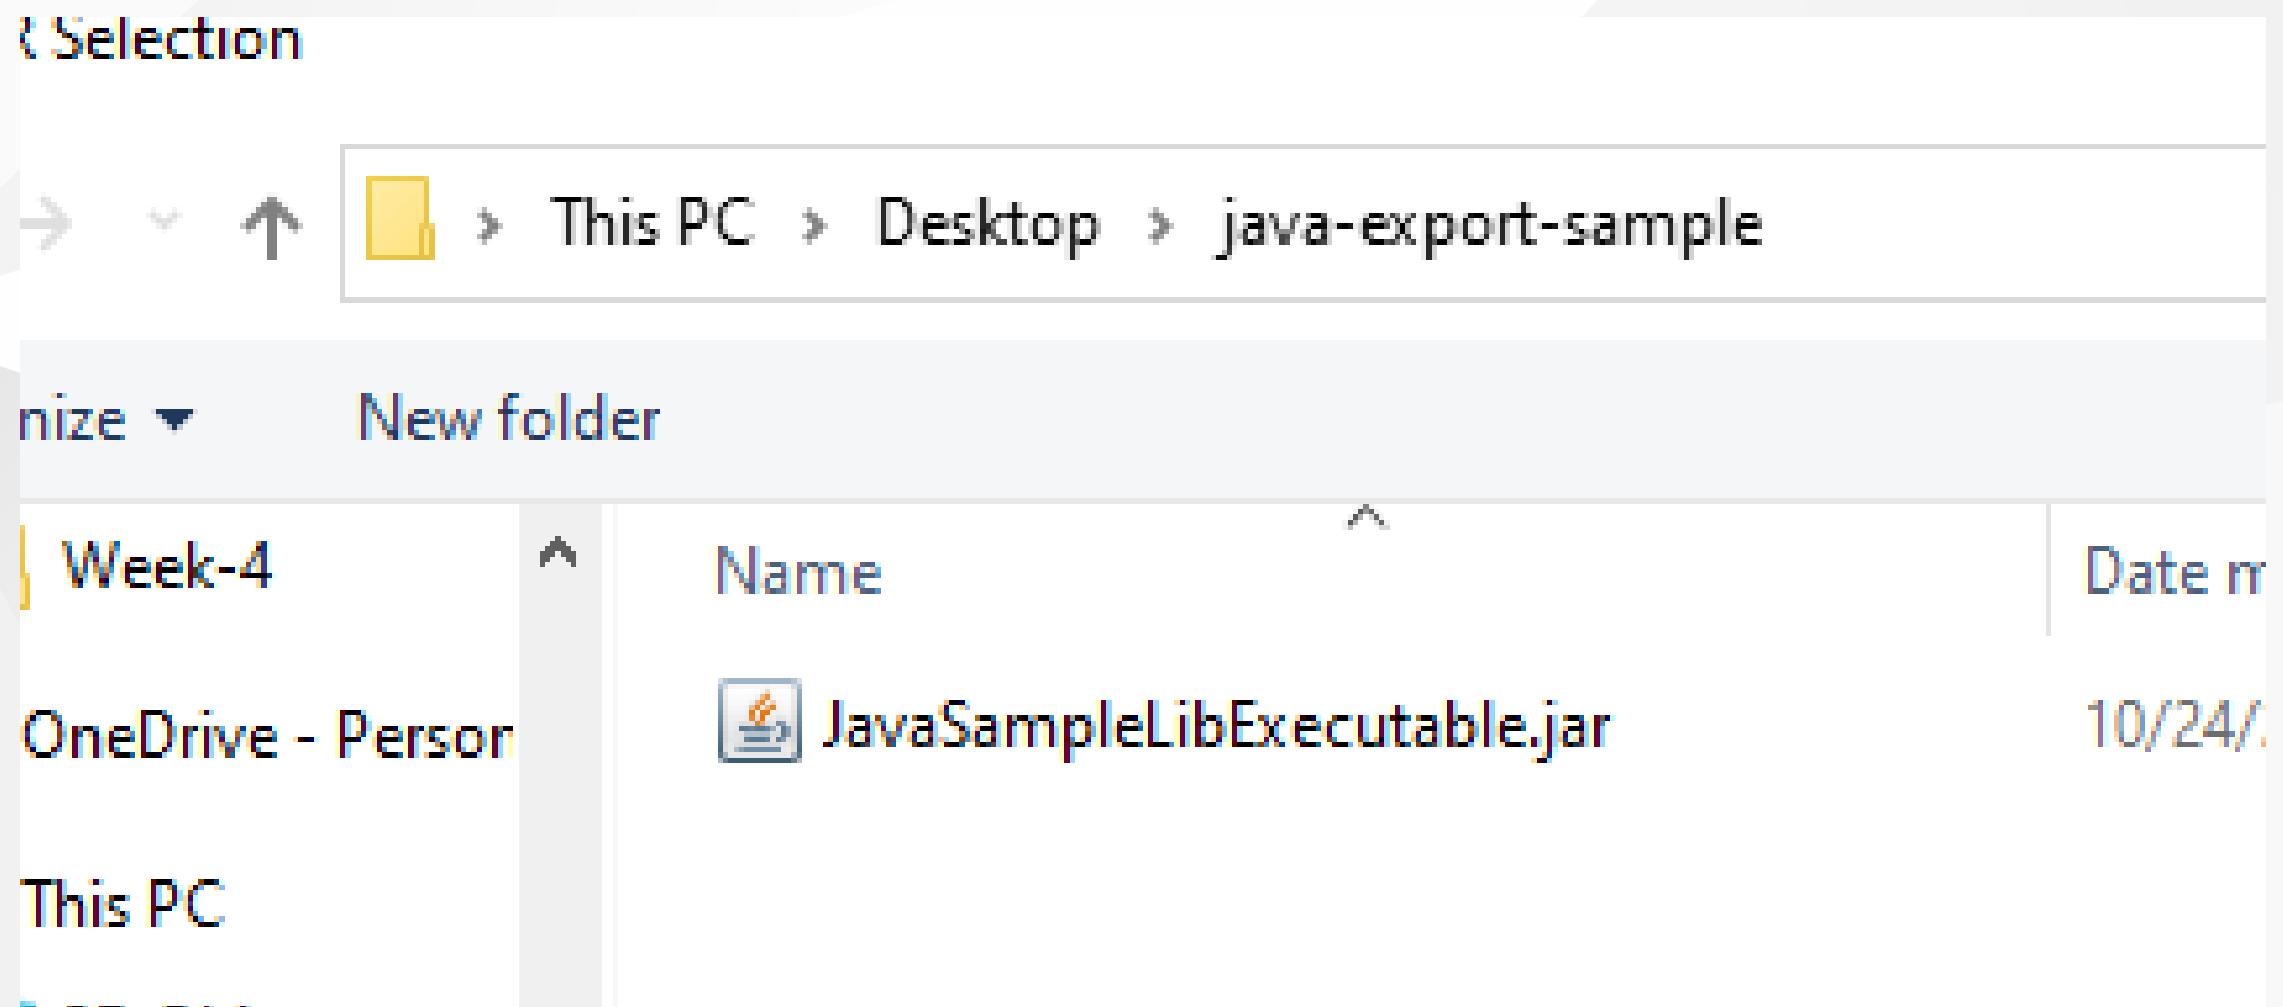

Select Add External JARs...

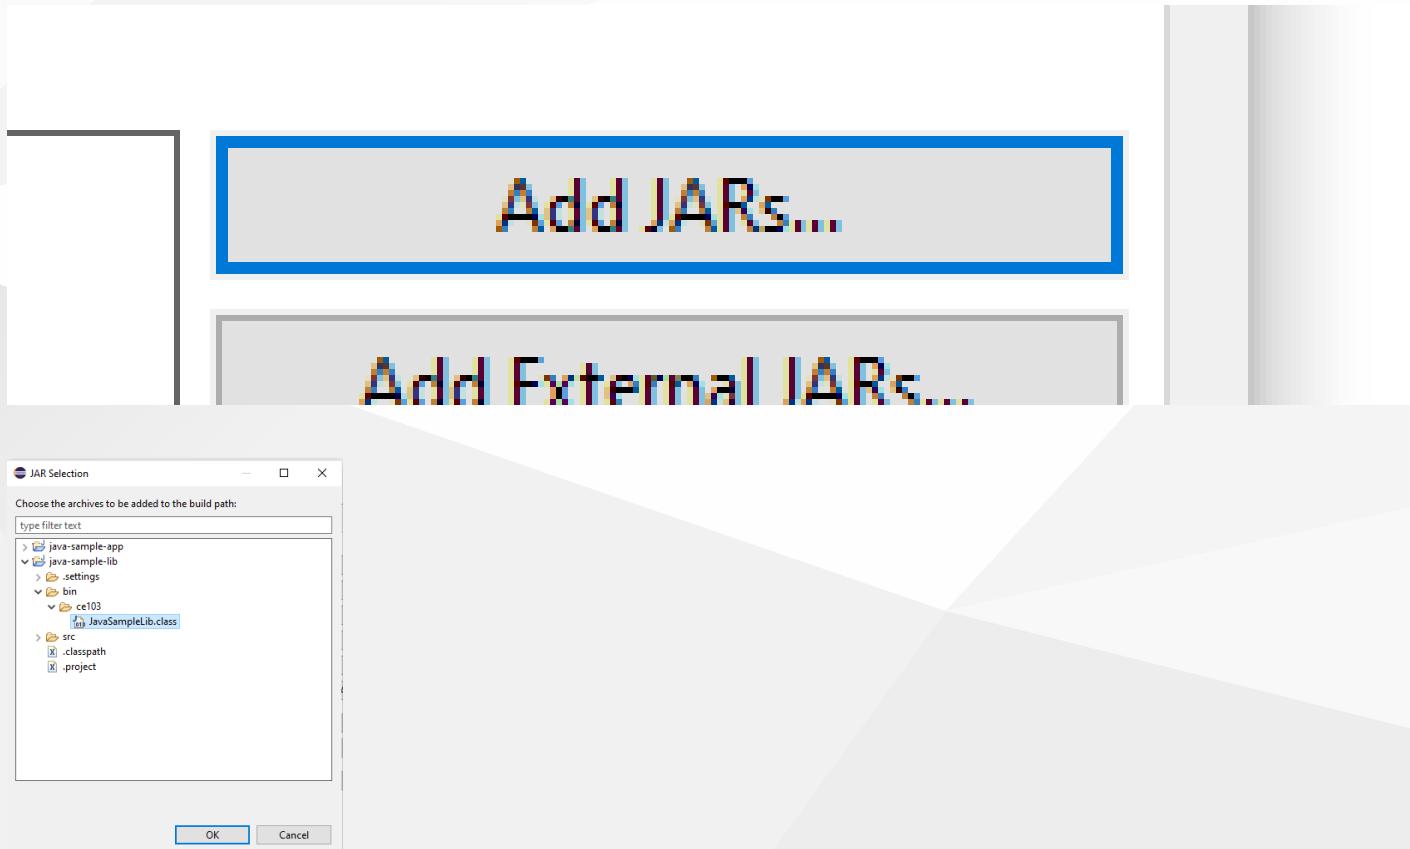

Add External JARs...

Add Variables

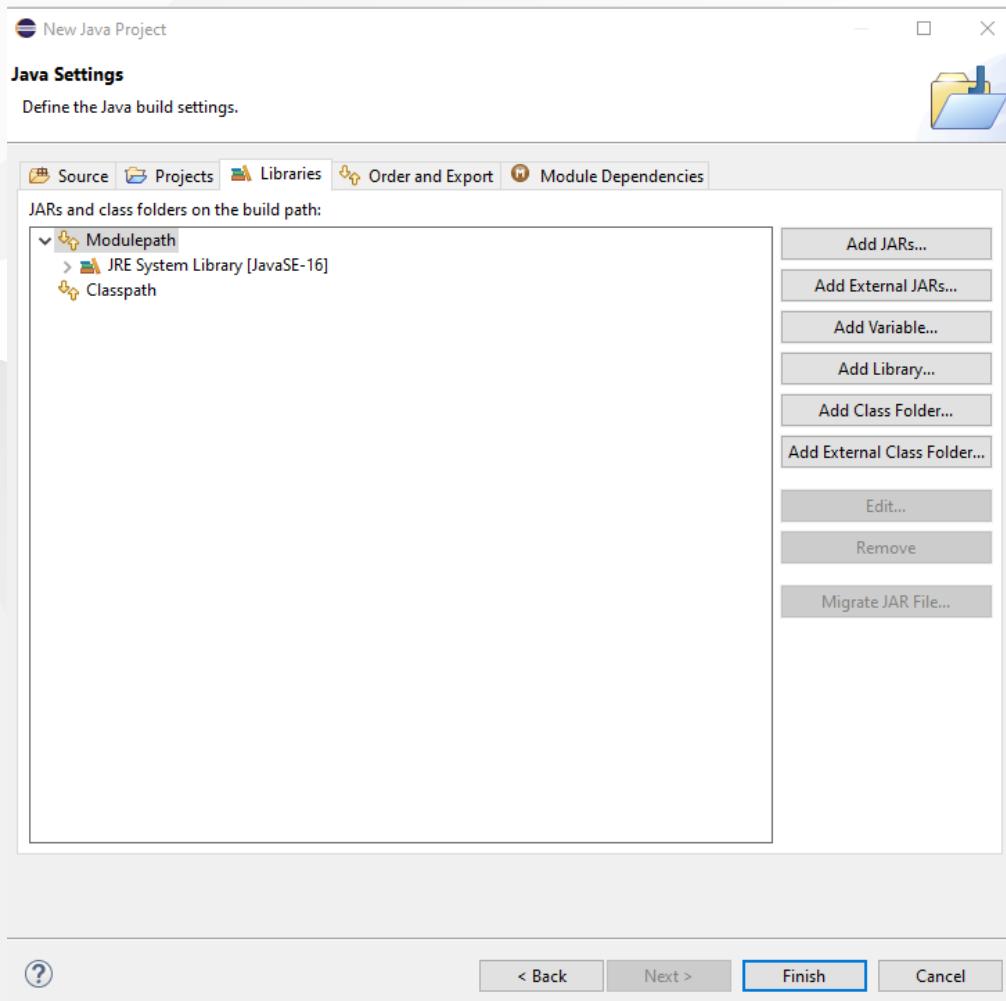

Open Exported jar folder and select

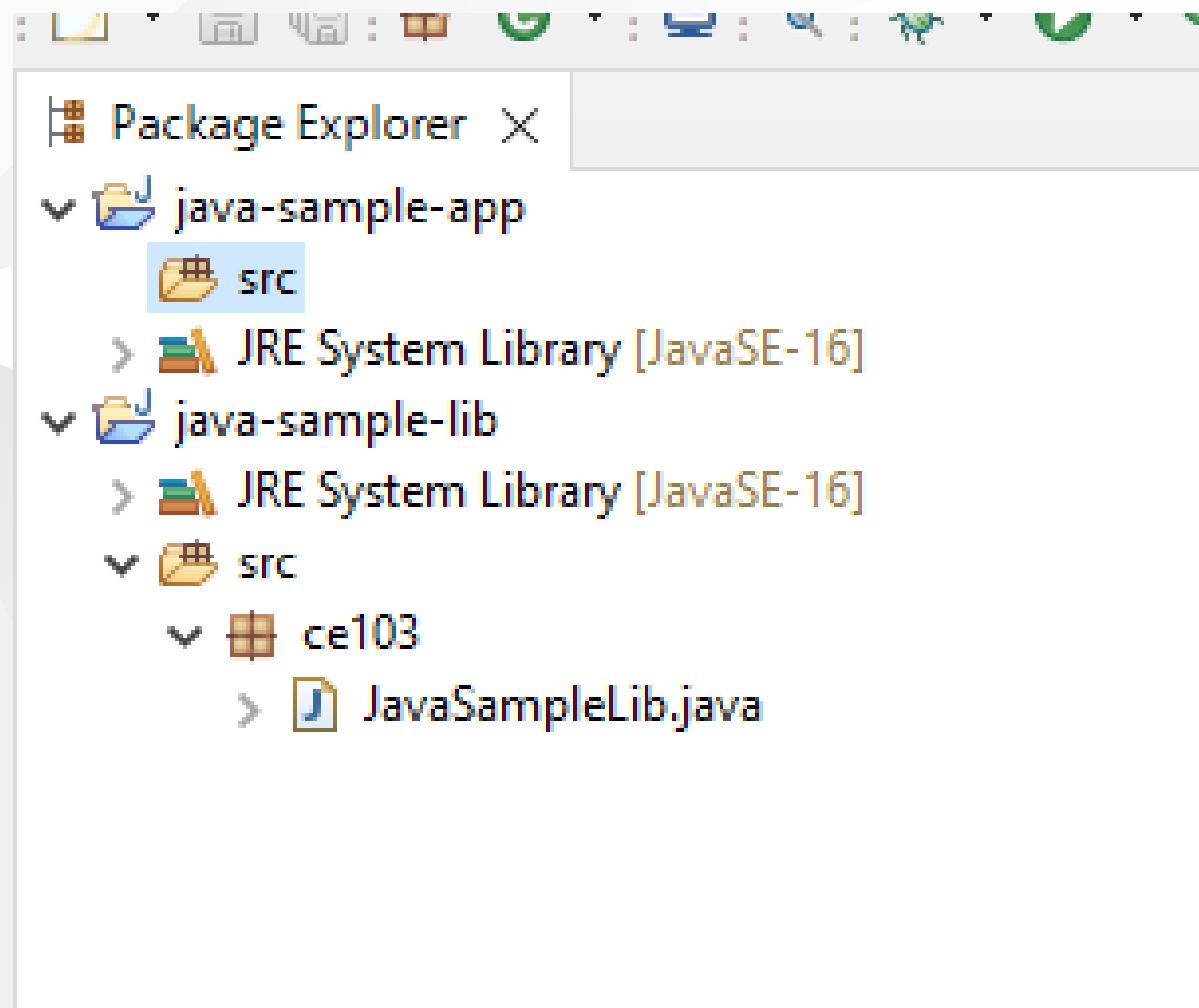

Or we can select by Add jar from current workspace

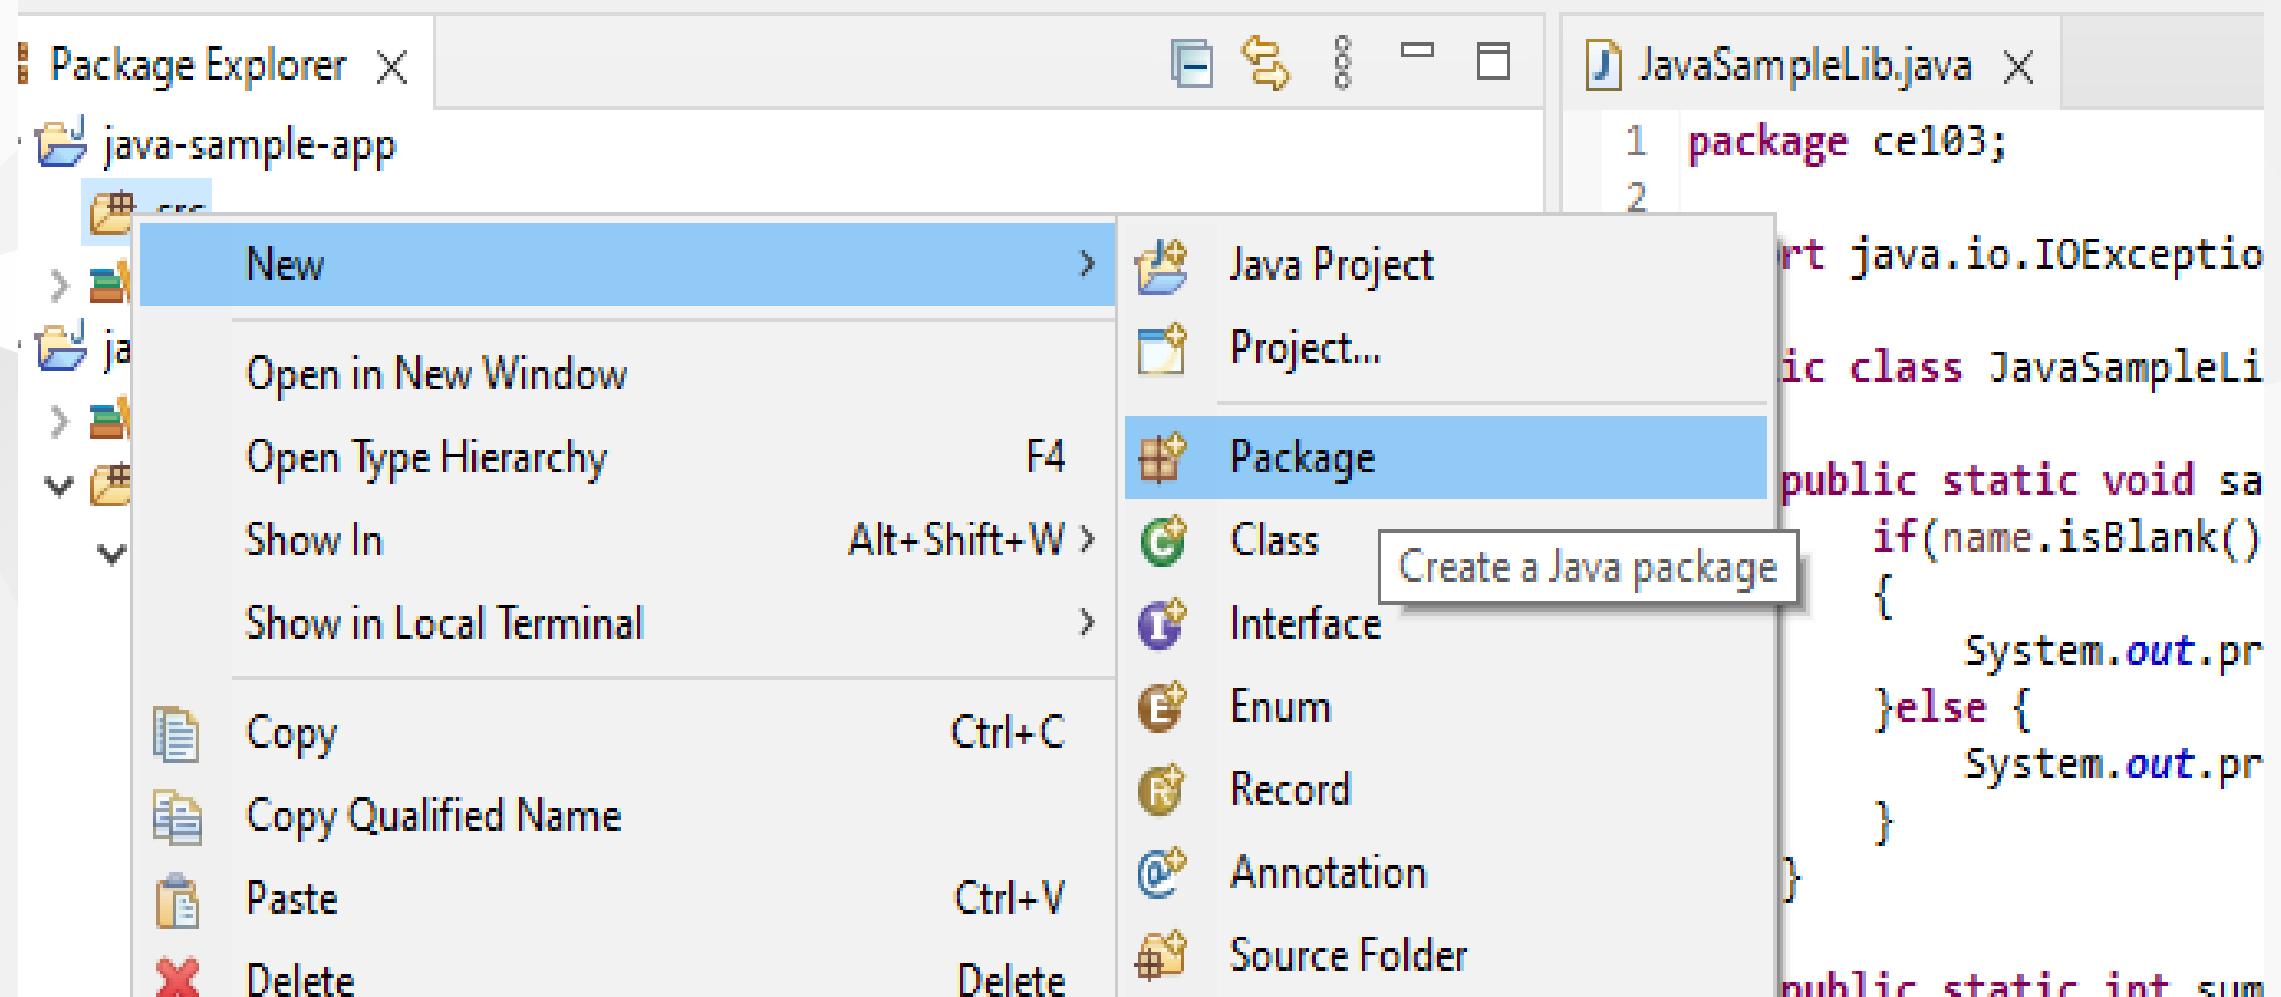

but in this step I won't add anything I'll add references later

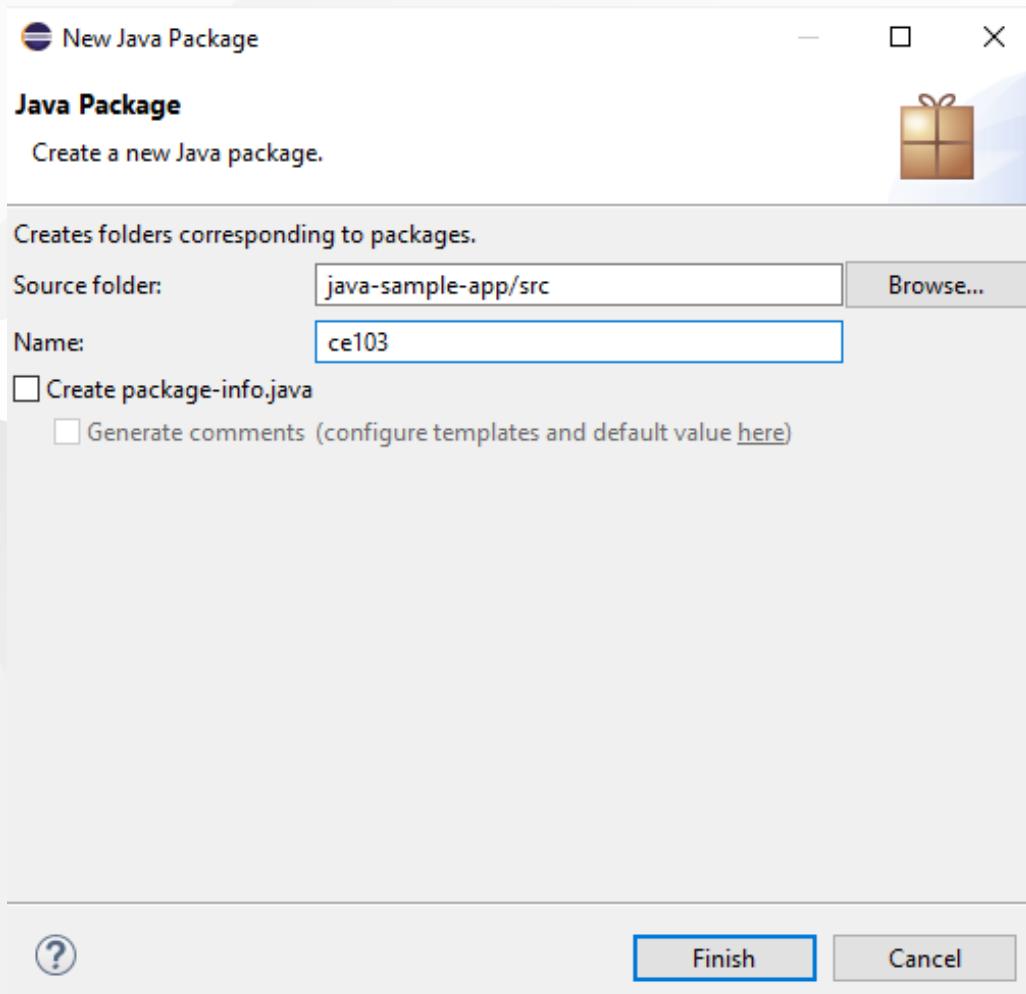

we will have the following project

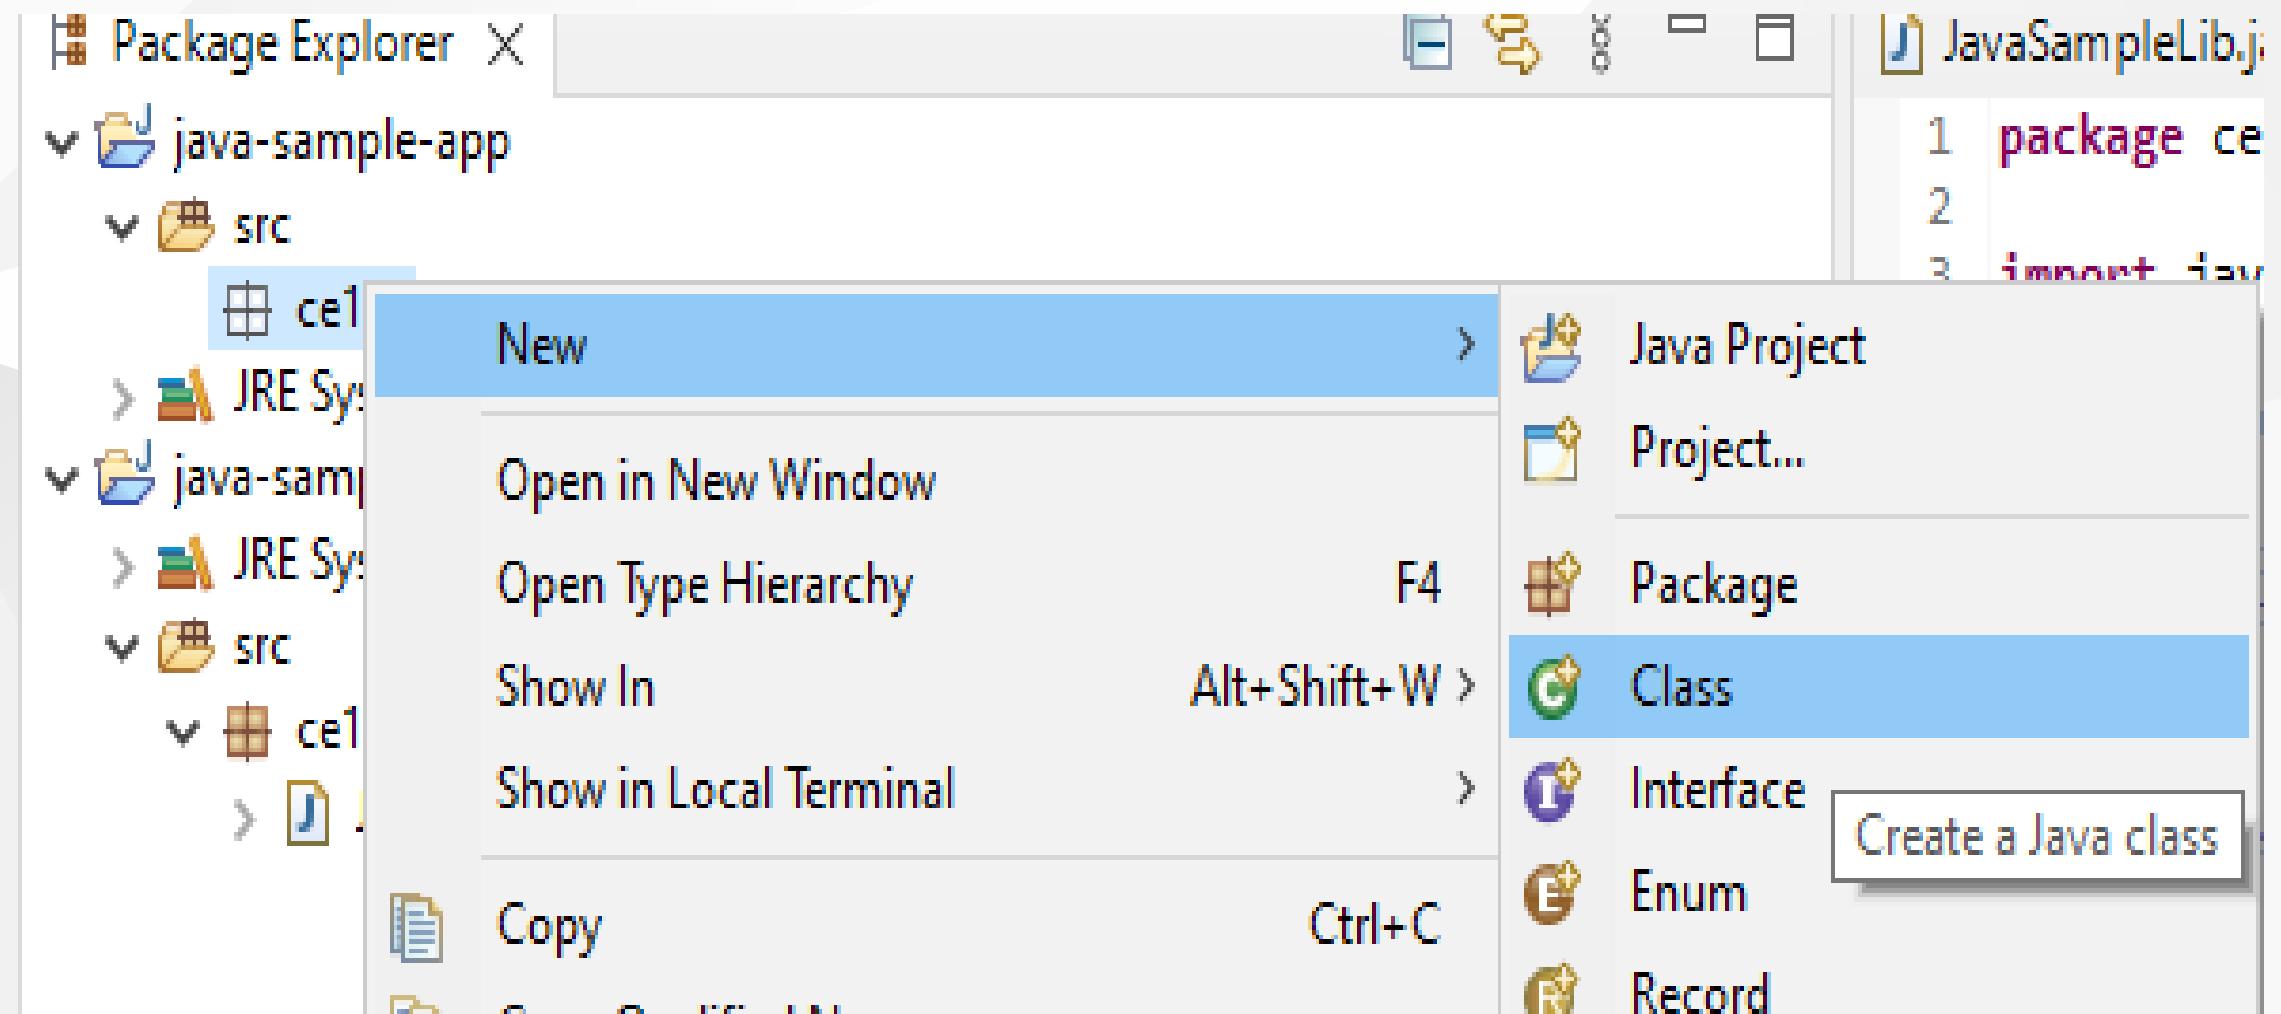

## lets create a package

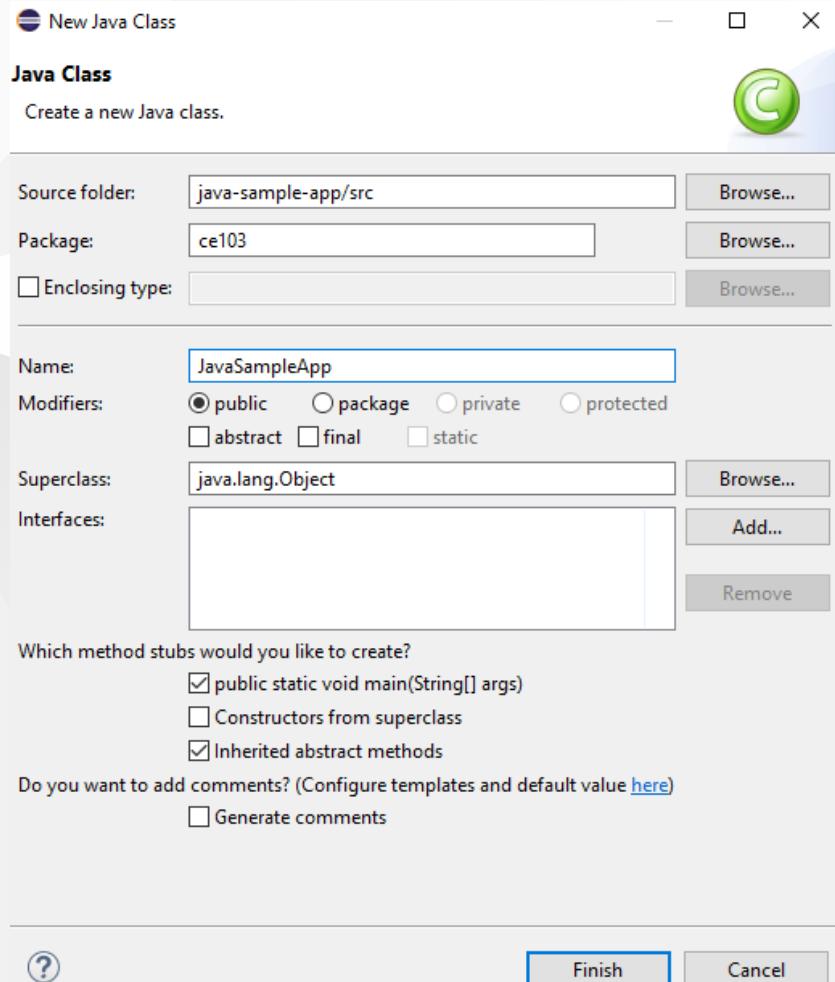

and lets create a main class for our application

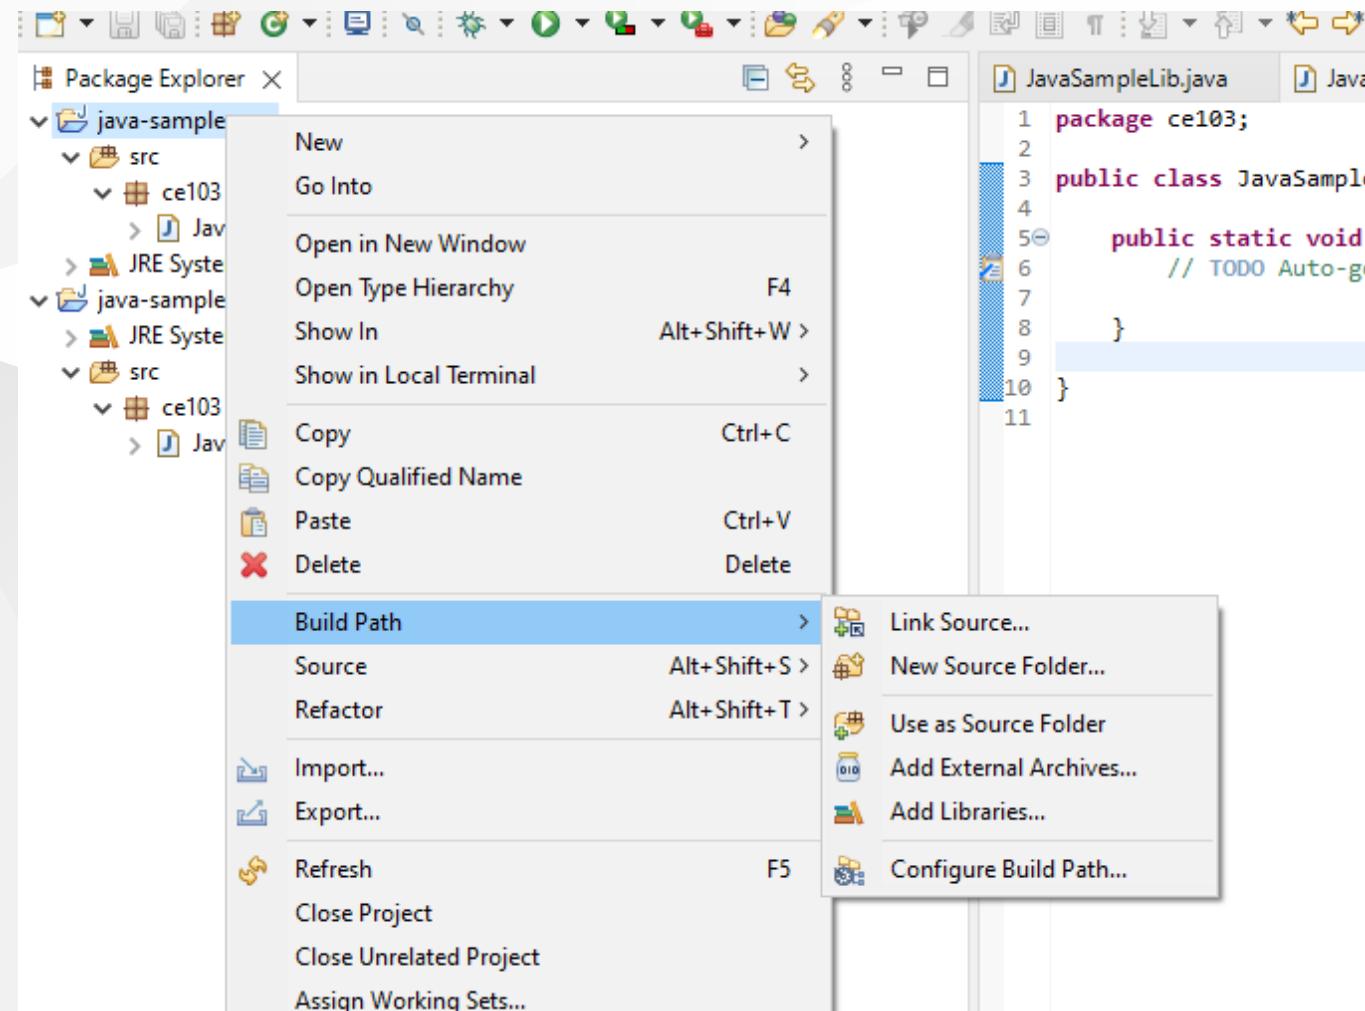

## check create main function

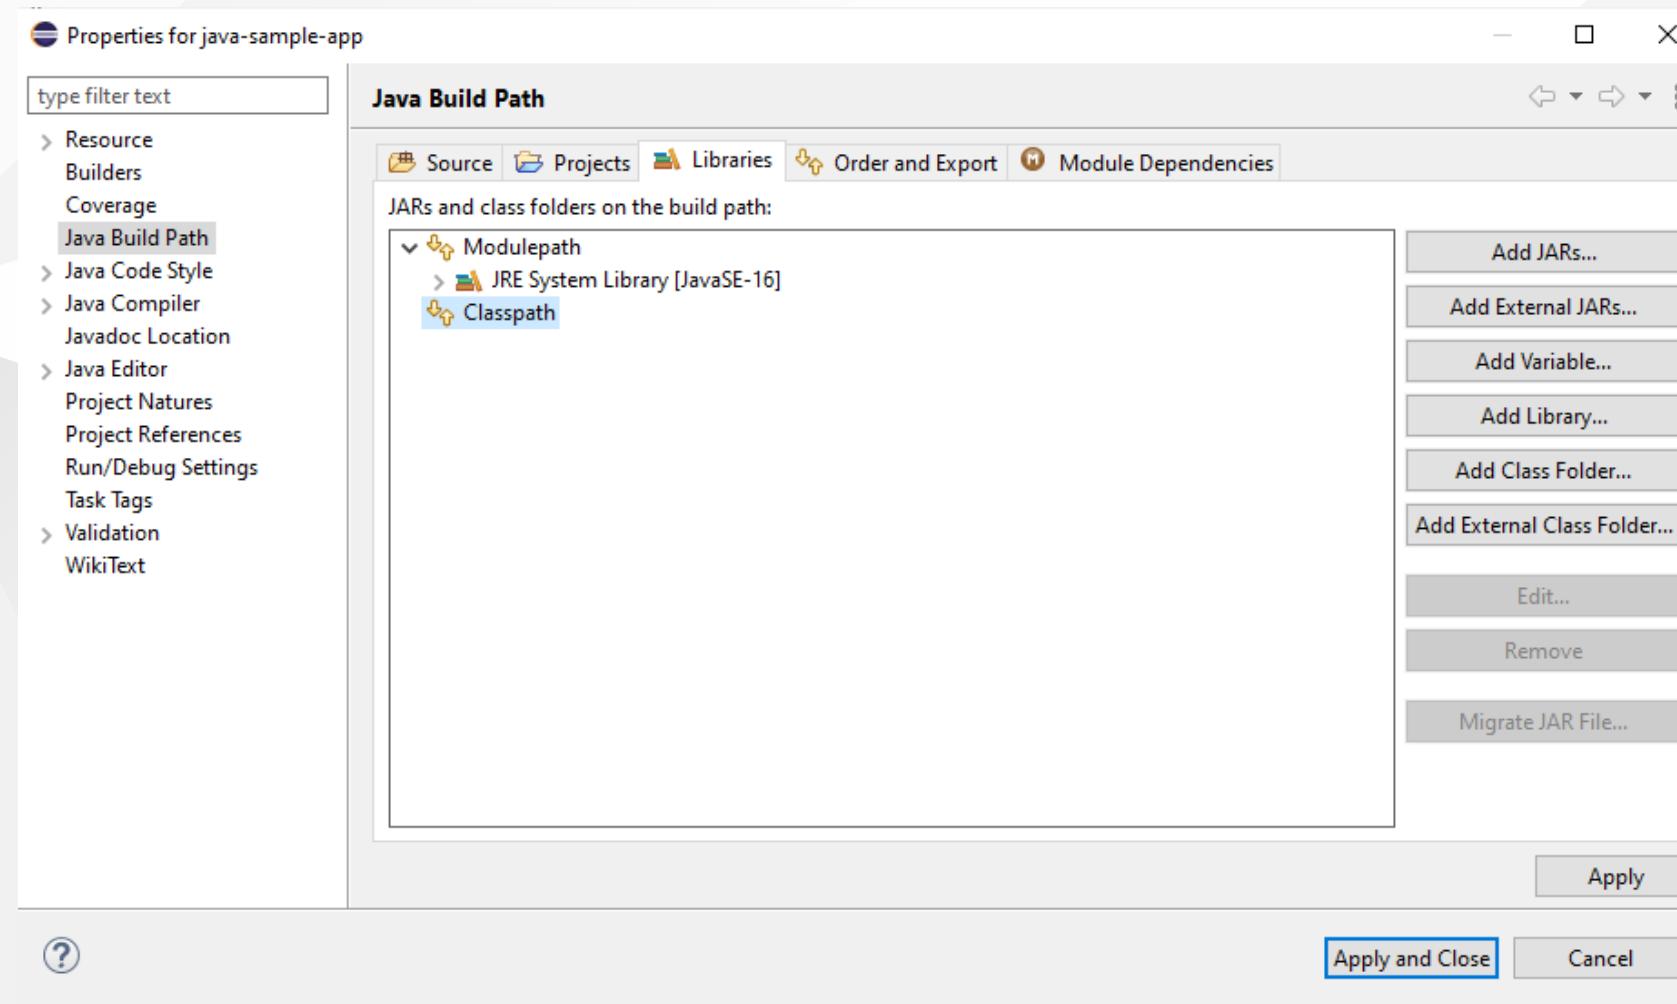

The screenshot shows the Eclipse IDE interface. The left pane is the Package Explorer, displaying two projects: 'java-sample-app' and 'java-sample-lib'. The 'java-sample-app' project contains a 'src' folder with a 'ce103' package containing 'JavaSampleApp.java'. This file is currently open in the editor. The 'java-sample-lib' project also contains a 'src' folder with a 'ce103' package containing 'JavaSampleLib.java'. The right pane shows the code for 'JavaSampleApp.java'. The code is as follows:

```
1 package ce103;
2
3 public class JavaSampleApp {
4
5     public static void main(String[] args) {
6         // TODO Auto-generated method stub
7
8     }
9
10 }
11
```

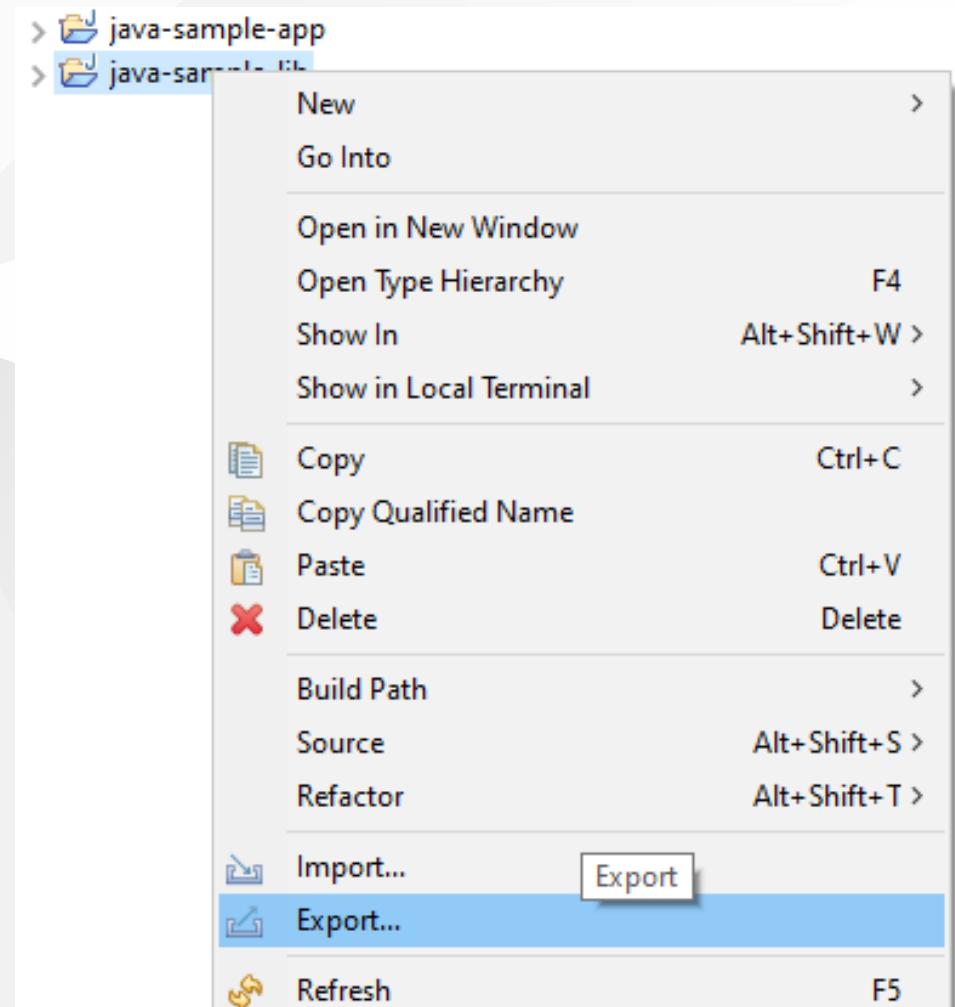

right click to project and add reference

you can enter same configurations from project properties

Lets export our library as a JAR file and then add to our classpath

## Select JAR file

Export resources into a JAR file on the local file system

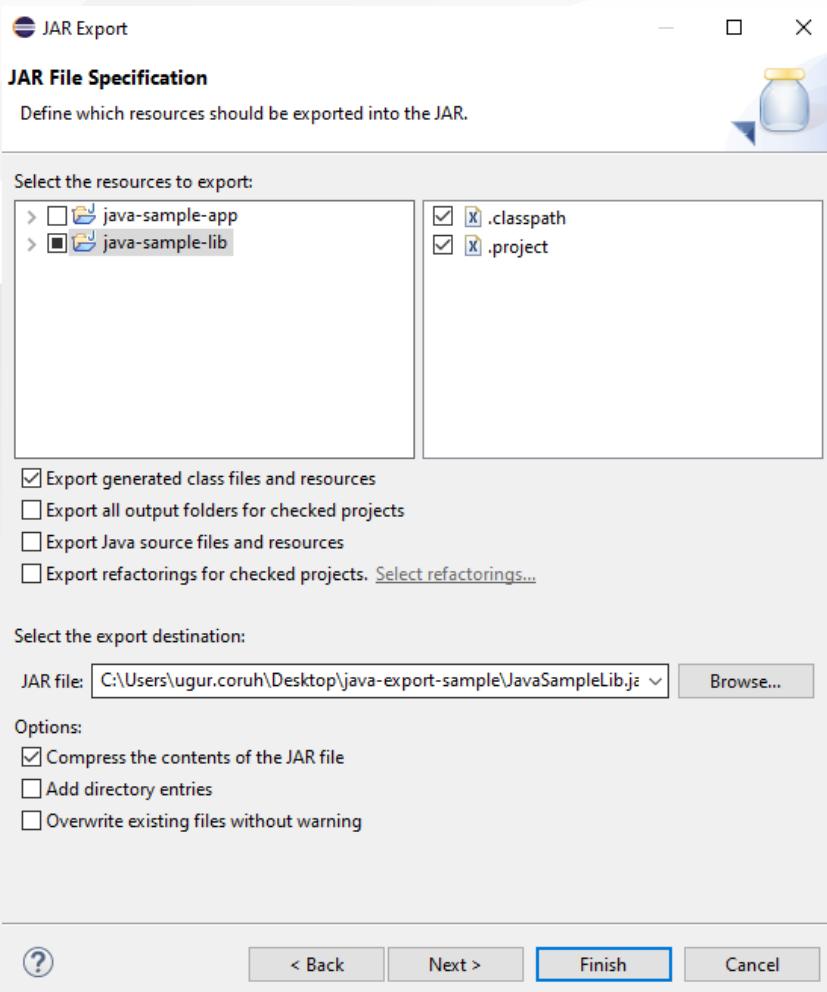

Select an export wizard:

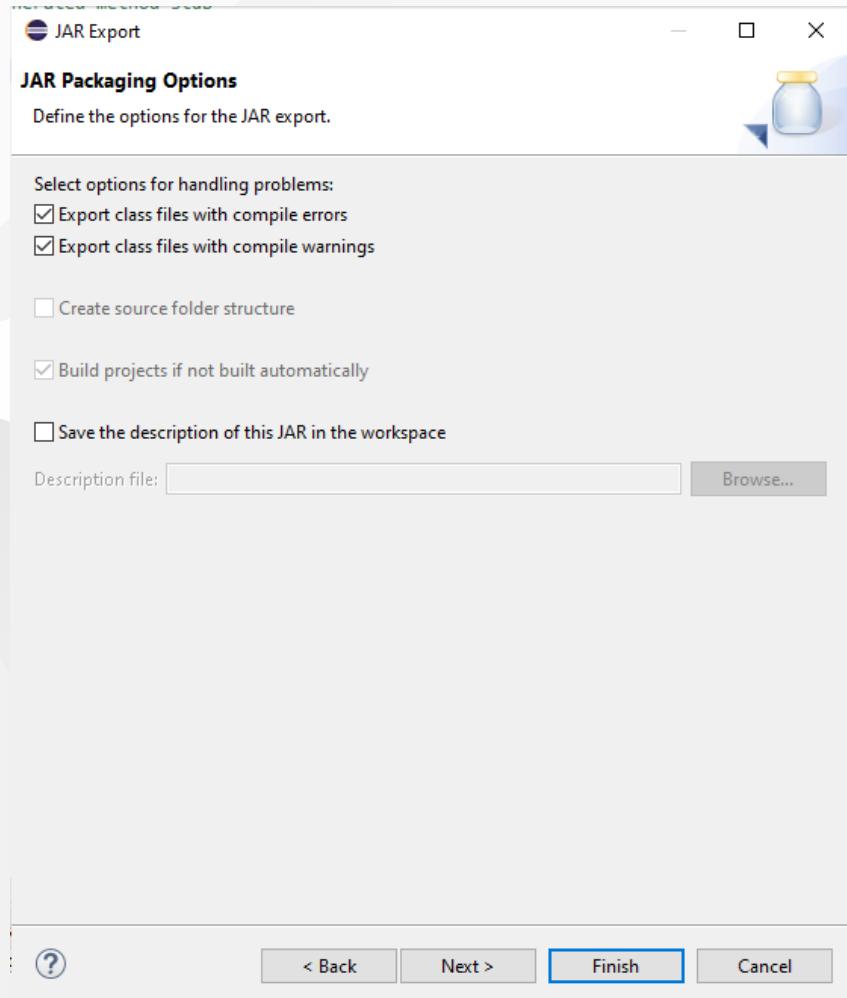

type filter text

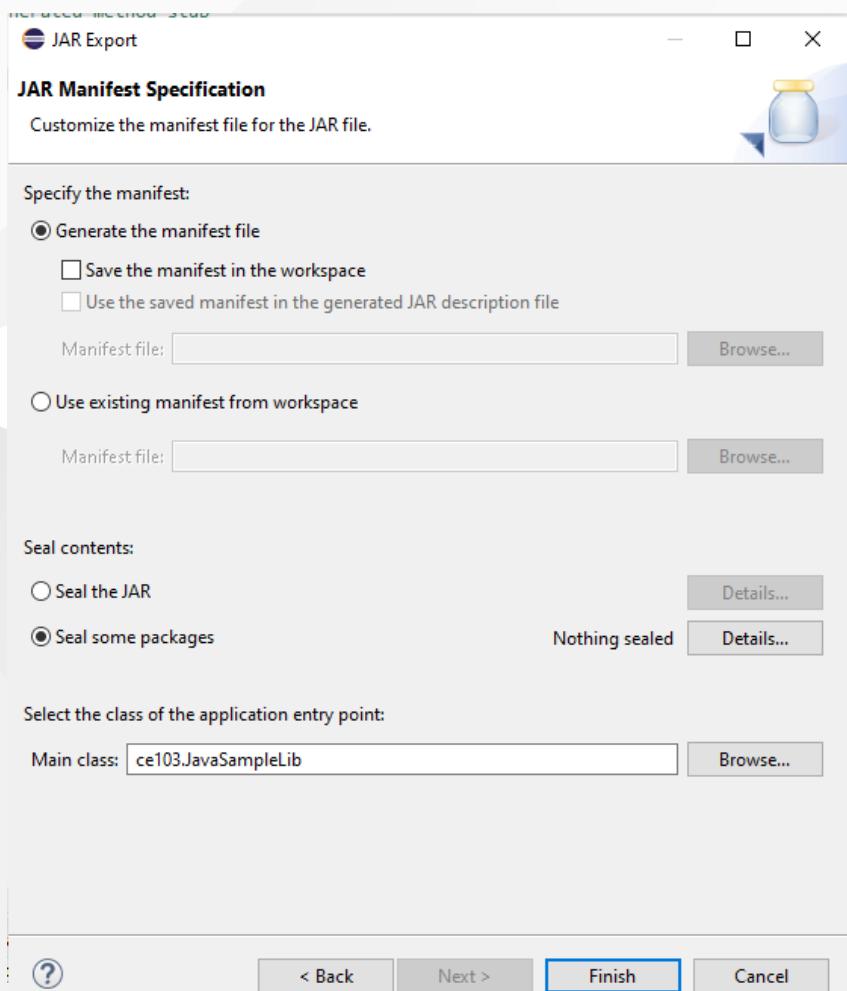

- ▼  Install
  -  Installed Software Items to File
- ▼  Java
  -  JAR file
  -  Javadoc
  -  Runnable JAR file
- ▼  Run/Debug
  -  Breakpoints
  -  Coverage Session
  -  Launch Configurations
- ▼  Team

we configured output as

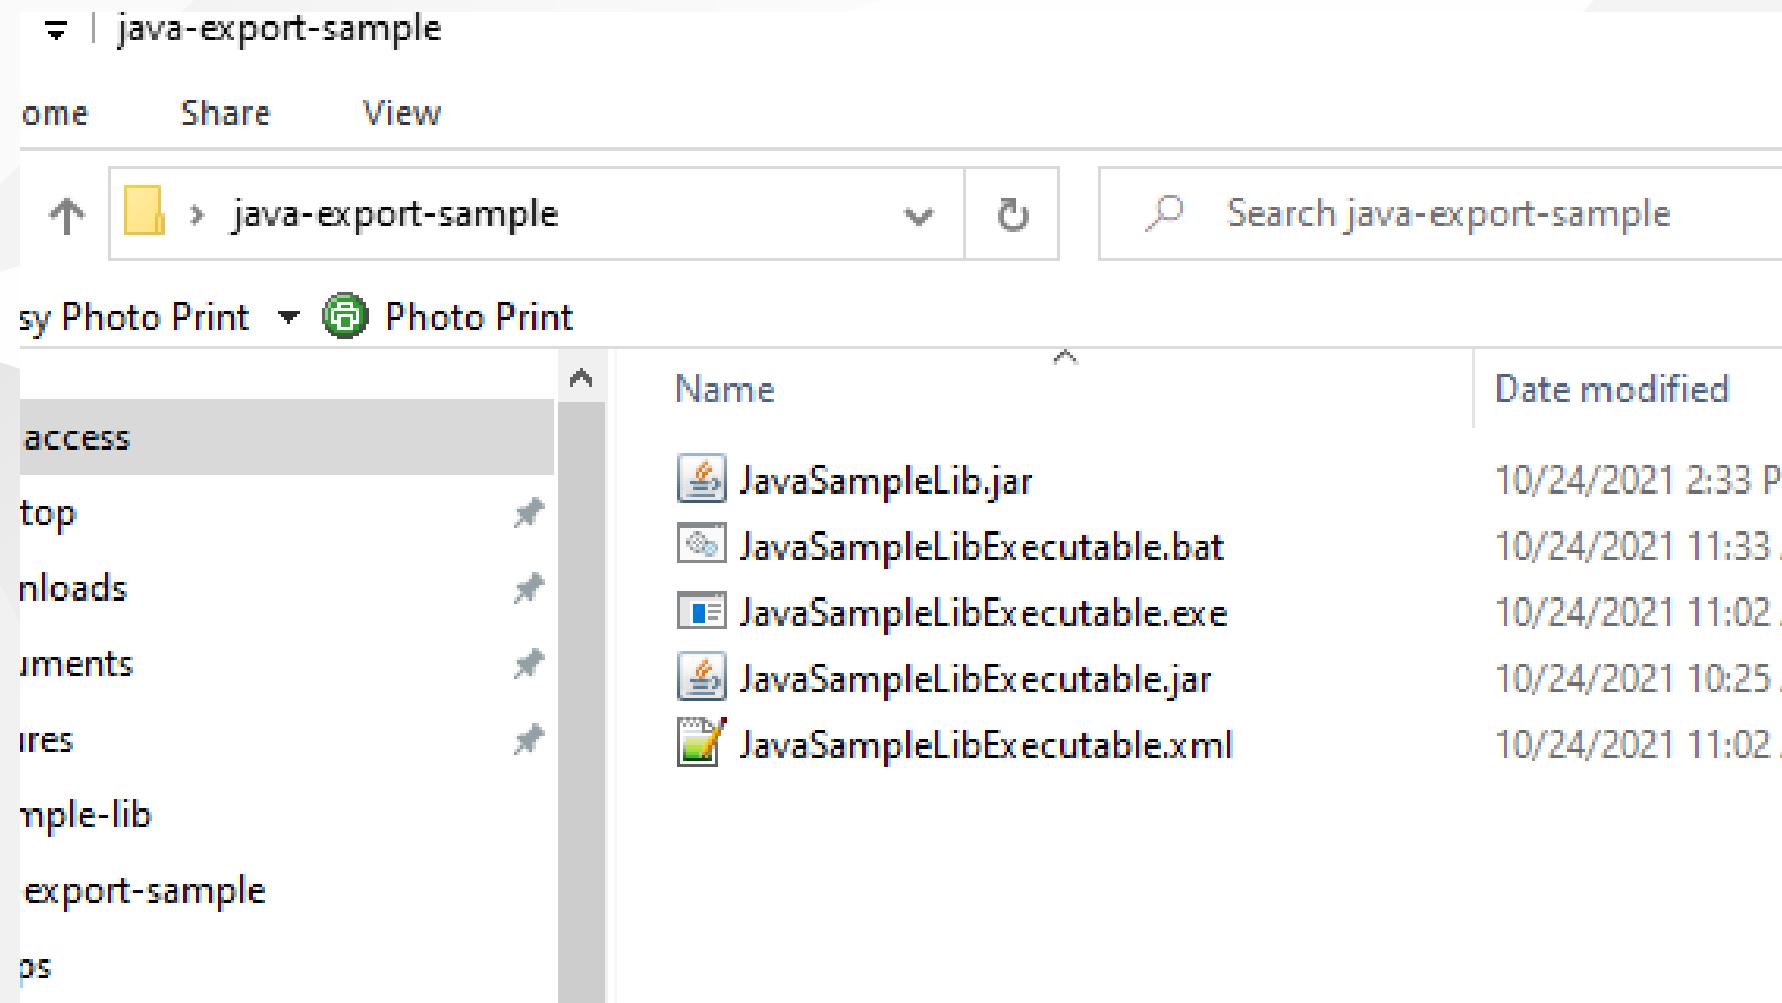

C:\Users\ugur.coruh\Desktop\java-export-sample\JavaSampleLib.jar

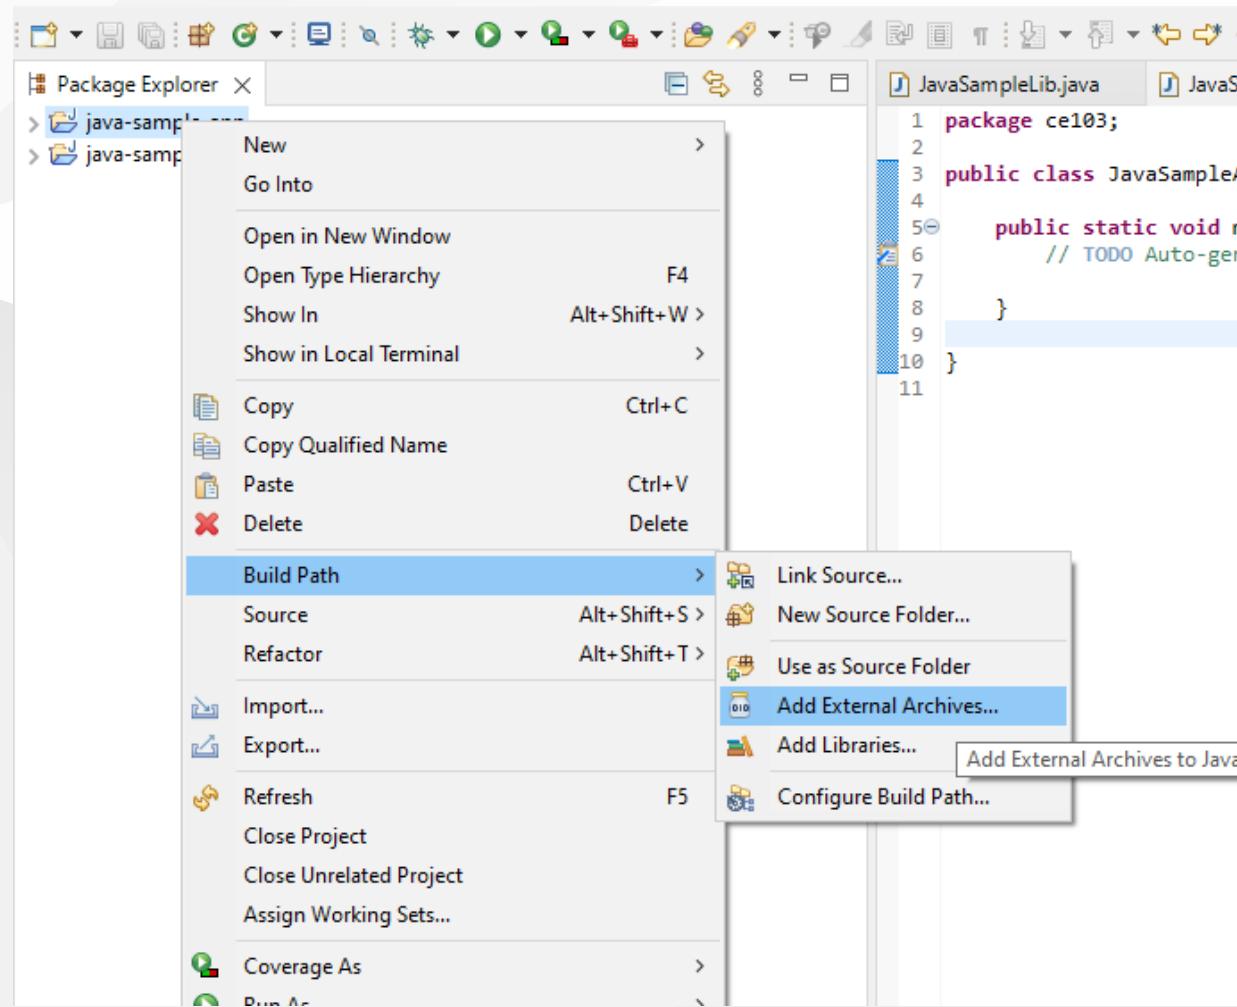

In the same export folder now we have JavaSampleLib.jar

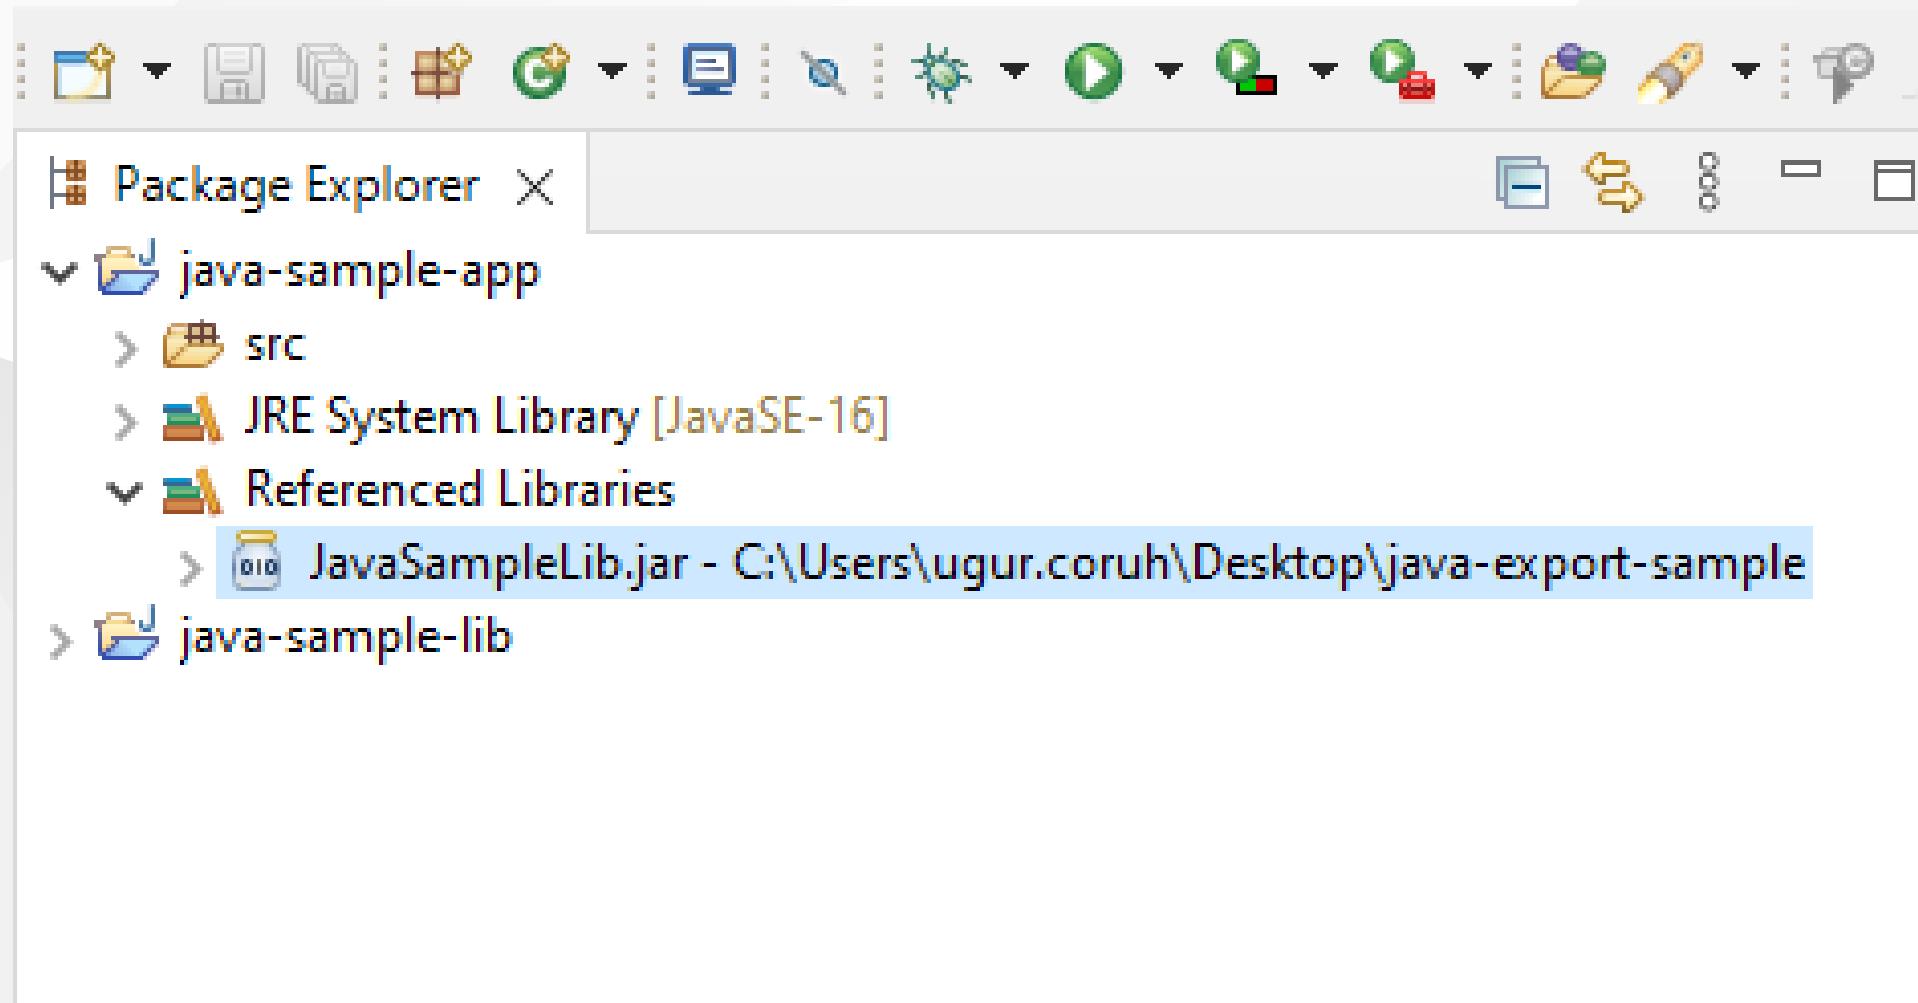

return back to java-sample-app and then add this jar file to our project

Build Path->Add External Archives

you will see its added to reference libraries

in our JavaSampleApp.java we can use the following source codes

```
package ce103;

import java.io.IOException;

public class JavaSampleApp {

    public static void main(String[] args) {
        // TODO Auto-generated method stub

        System.out.println("Hello World!");

        JavaSampleLib.sayHelloTo("Computer");
        int result = JavaSampleLib.sum(5, 4);
        System.out.println("Results is " + result);
        System.out.printf("Results is %d \n", result);

        try {
            System.in.read();
        } catch (IOException e) {
            // TODO Auto-generated catch block
            e.printStackTrace();
        }
    }
}
```

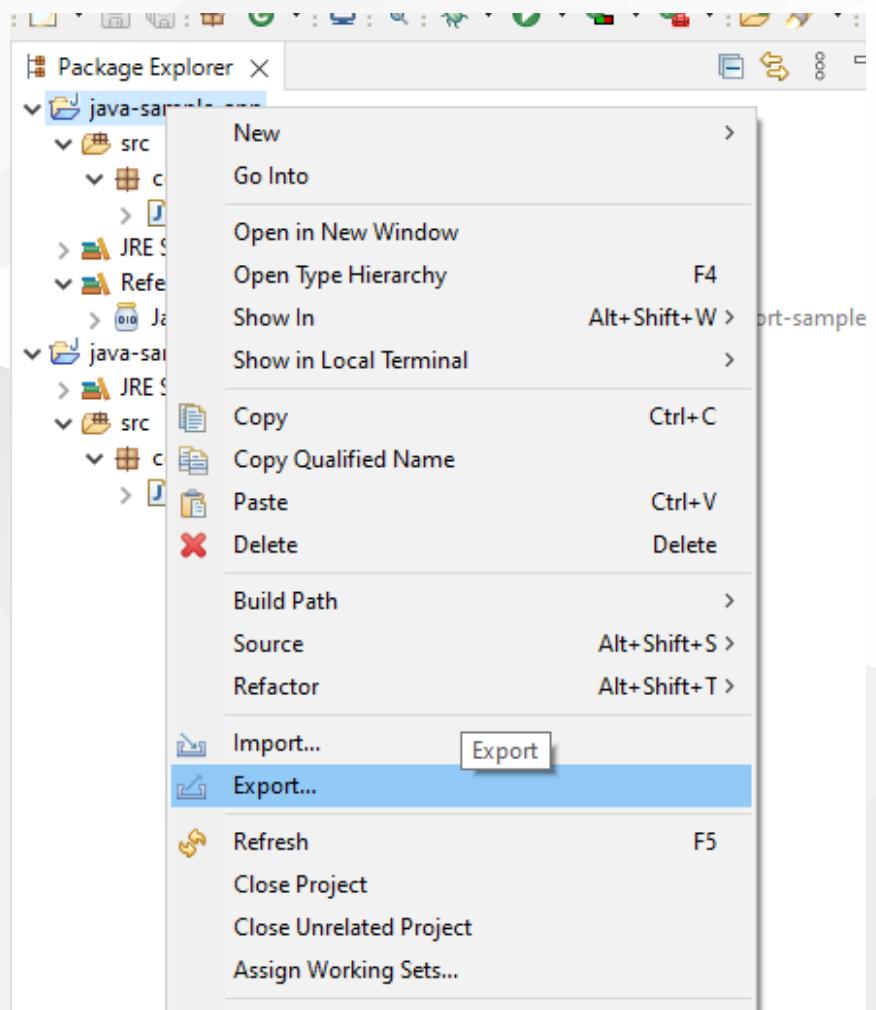

When we run application we will see similar output

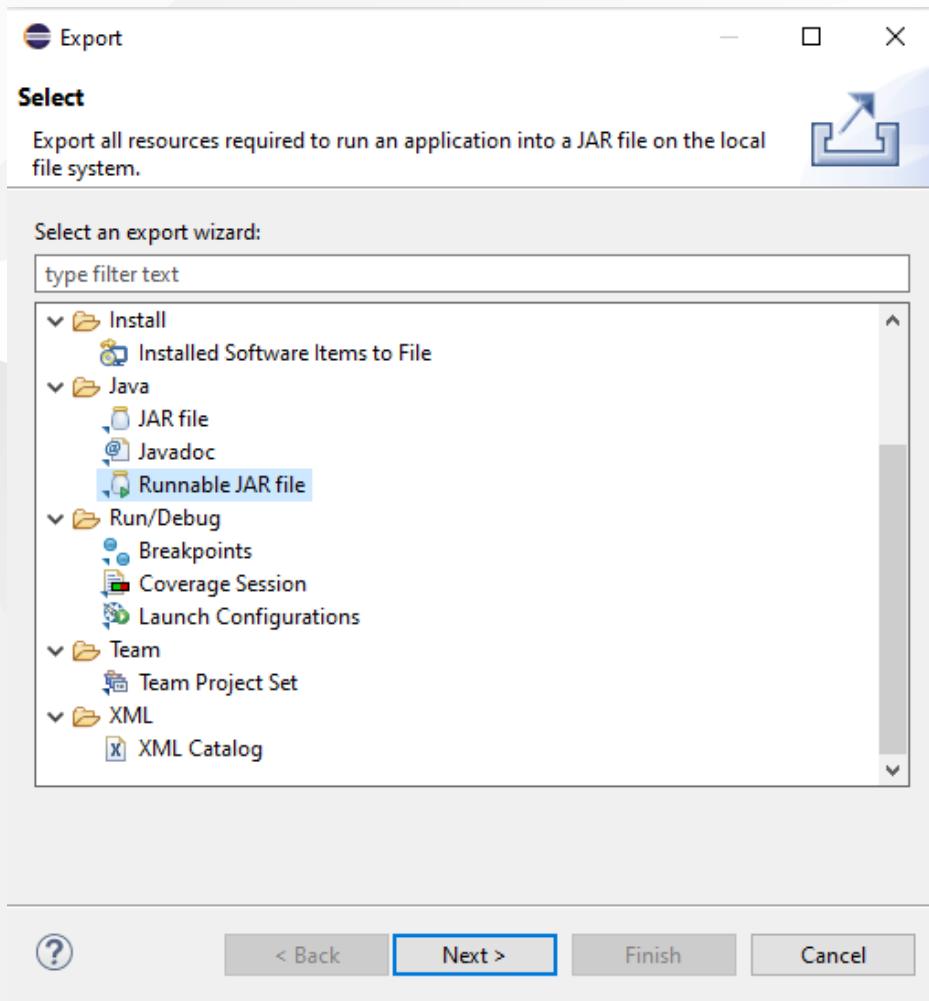

A screenshot of an IDE interface, specifically the 'Console' tab, showing the output of a Java application named 'JavaSampleApp'. The console window title is 'JavaSampleApp [Java Application] C:\Program Files\Java\jdk-16.0.1\bin\javaw.exe (Oct 24, 2021, 2:37:50 PM)'. The output text is:  
Hello World!  
Hello There  
Results is9  
Results is 9

Lets export this application with its dependent library

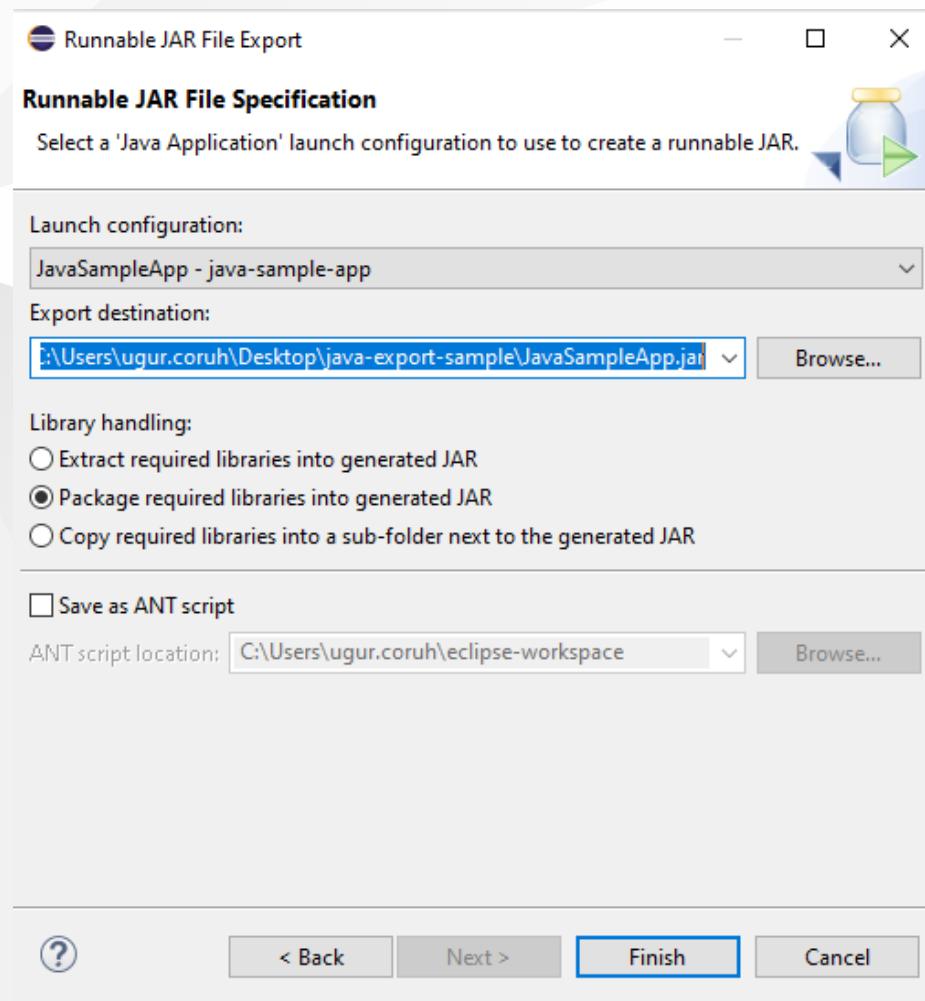

## Select runnable jar

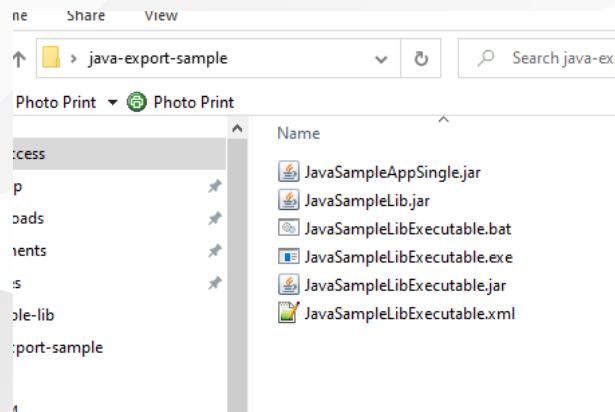

## Set Launch configuration and Export destination

C:\Users\ugur.coruh\Desktop\java-export-sample\JavaSampleAppSingle.jar

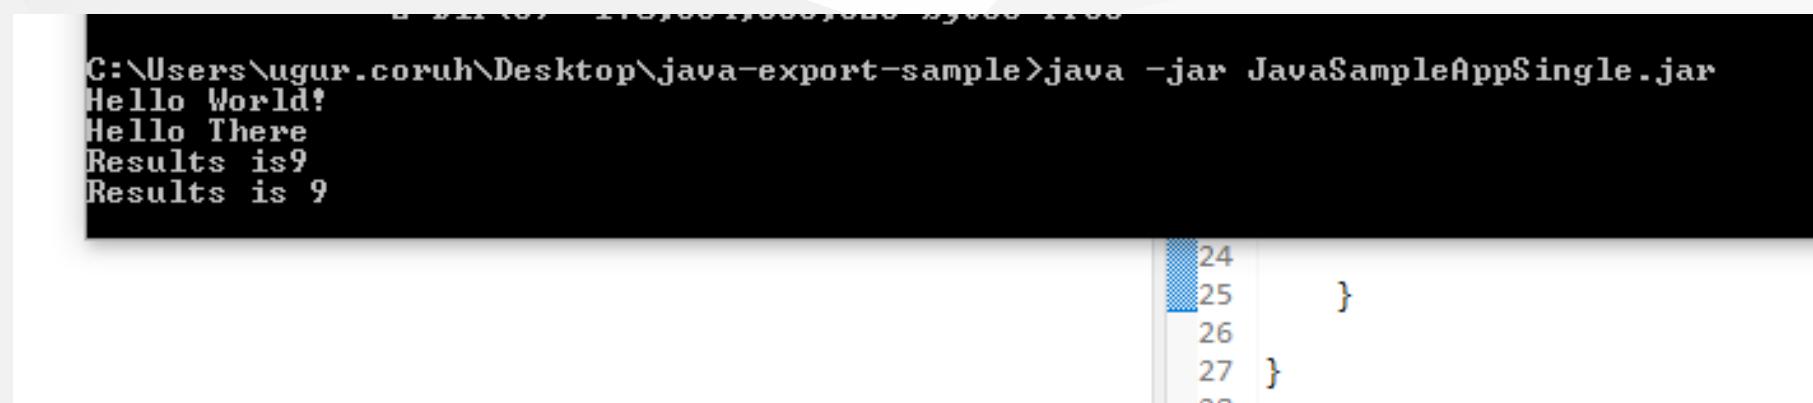

In this option we will have single jar file

In the export folder we do not see reference libraries

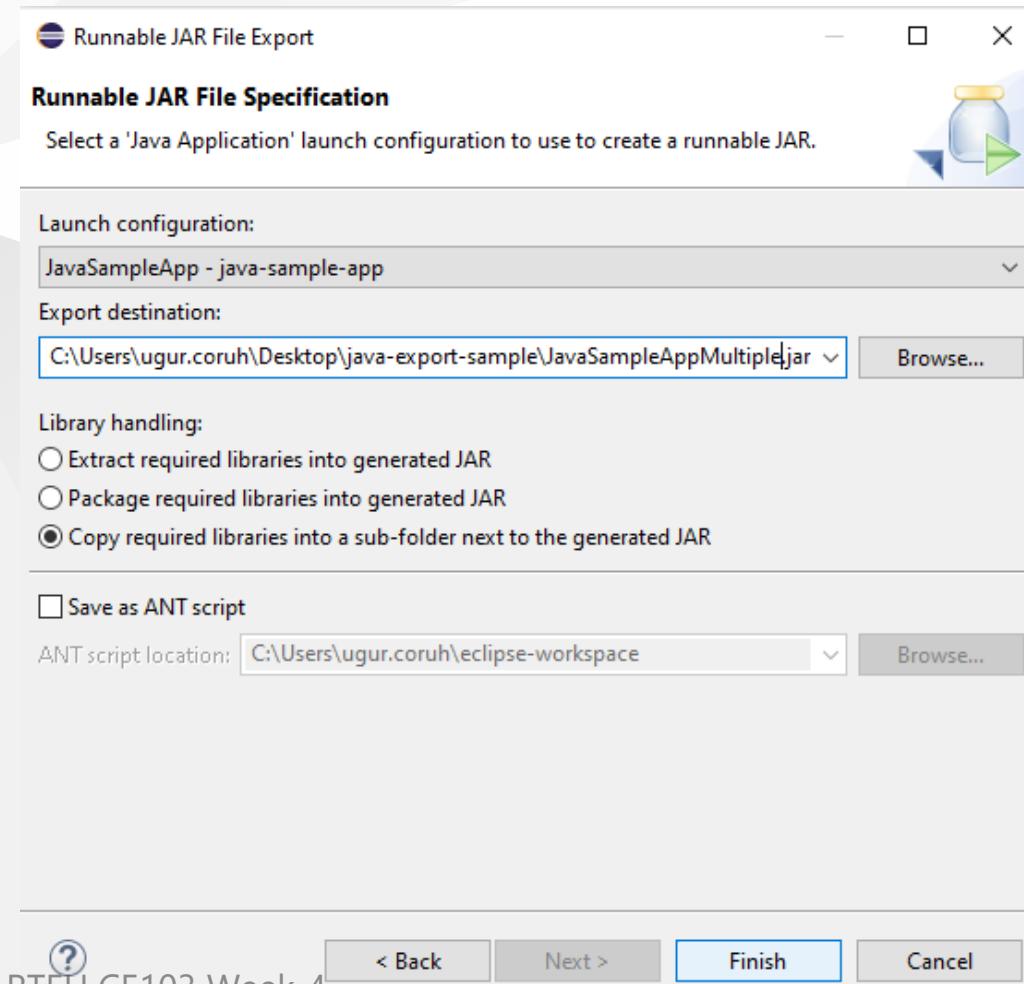

and we can run with command line

```
C:\Users\ugur.coruh\Desktop\java-export-sample>java -jar JavaSampleAppSingle.jar
Hello World!
Hello There
Results is 9
Results is 9
```

only change copy required libraries setting and then give a new name for new jar file and export

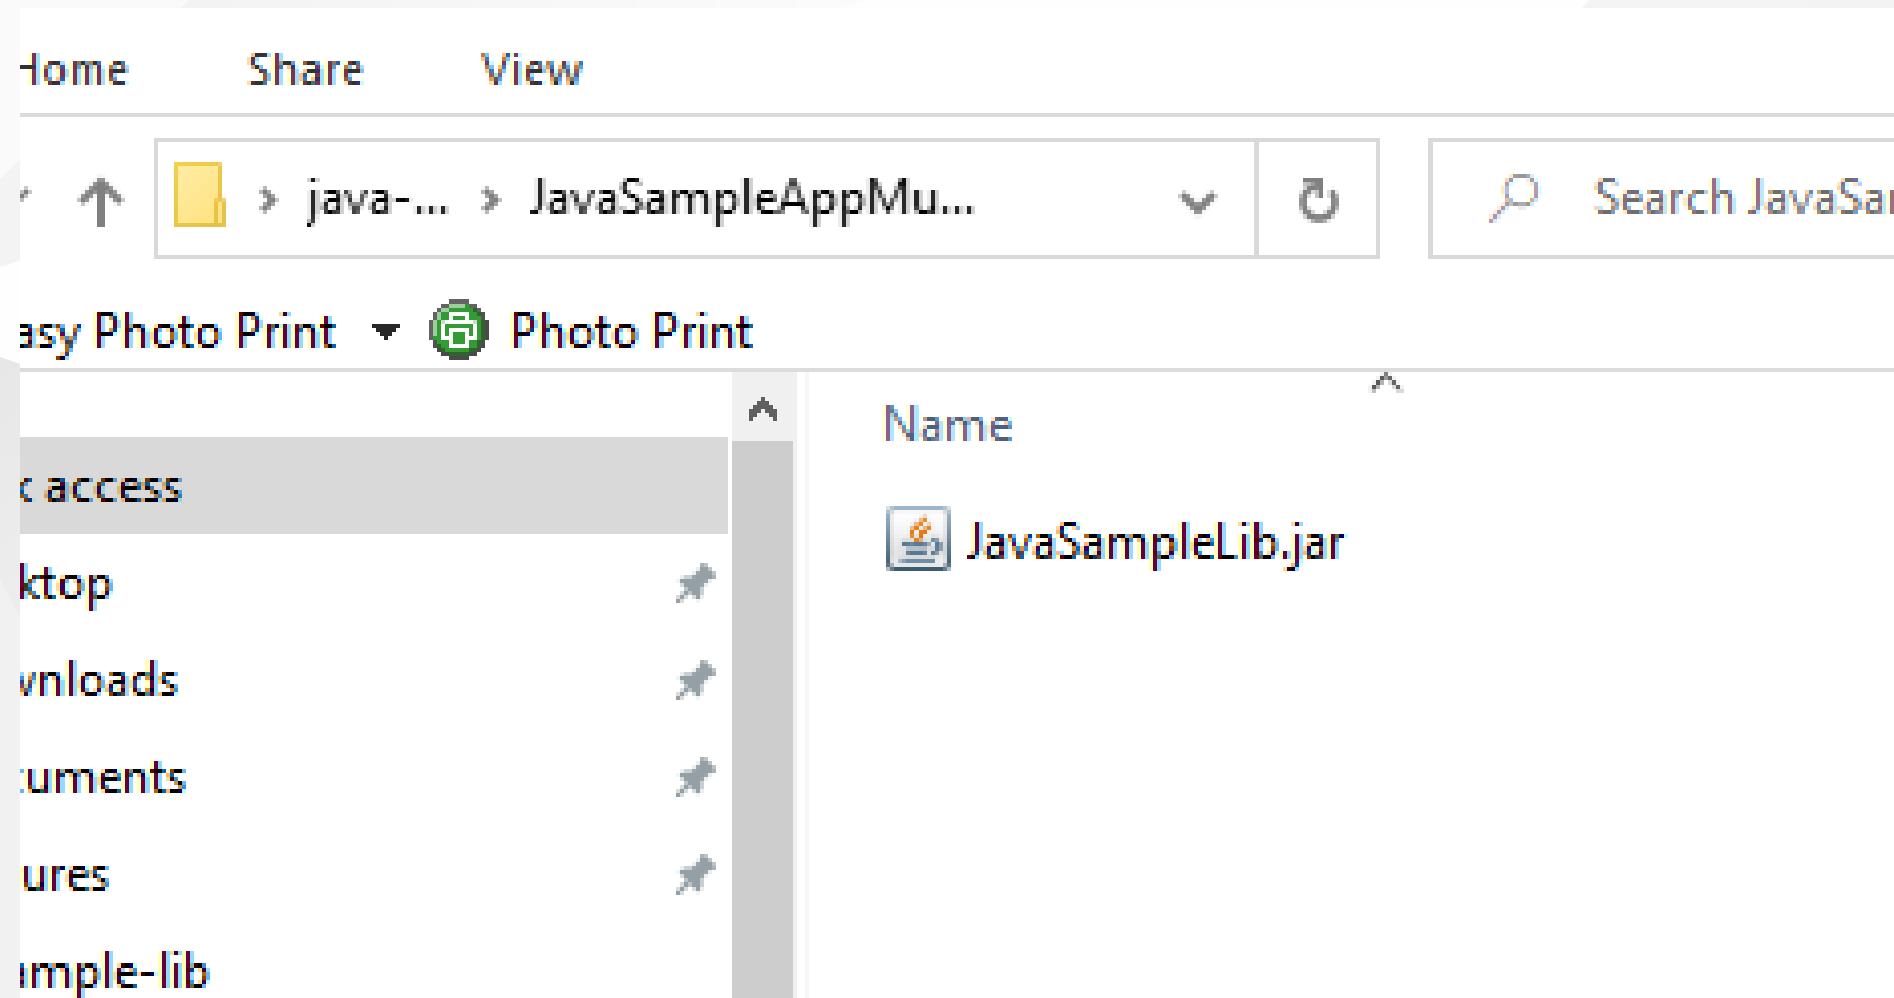

C:\Users\ugur.coruh\Desktop\java-export-sample\JavaSampleAppMultiple.jar

now we have a folder that contains our libraries referenced

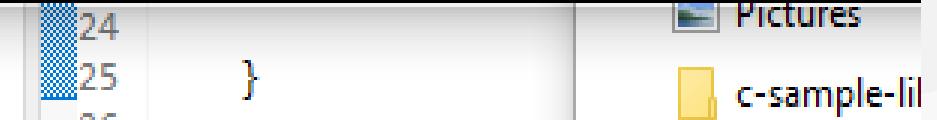

Name
JavaSampleAppMultiple_lib
JavaSampleAppMultiple.jar
JavaSampleAppSingle.jar
JavaSampleLib.jar

in this file we can find our library

if we test our application we will see it will work

```
C:\Users\ugur.coruh\Desktop\java-export-sample>java -jar JavaSampleAppMultiple.jar
Hello World!
Hello There
Results is9
Results is 9
```

if we delete JavaSampleLib.jar and then try running application we will get error

```
C:\Users\ugur.coruh\Desktop\java-export-sample>java -jar JavaSampleAppMultiple.jar
Hello World!
Exception in thread "main" java.lang.NoClassDefFoundError: ce103/JavaSampleLib

**C++ Unit Tests**

# Visual Studio Community Edition

## C/C++ için birim testleri yazma - Visual Studio (Windows) | Microsoft Docs

Use cpp-sample-lib project and add

## select Native Unit Test

The screenshot shows the Microsoft Visual Studio Marketplace search interface. A search bar at the top contains the text "Search for templates (Alt+S)". Below it are three dropdown filters: "C++", "All platforms", and "Test", with "Test" currently selected. A "Clear all" link is also present. The search results list two items:

- Native Unit Test Project**: Write C++ unit tests using the native Microsoft CppUnitTest framework. It includes icons for C++, Windows, and Test. The "Test" icon is highlighted with a yellow border.
- Google Test**: Write C++ unit tests using Google Test. Includes a copy of the Google Test library for use. It includes icons for C++, Windows, and Test.

At the bottom right of the search results area, there is a callout with the text "Not finding what you're looking for? [Install more tools and features](#)".

## you will have cpp-sample-test project

## add library project from references

## Add cpp-sample-lib to cpp-sample-test project

## cpp-sample-test.cpp

```
#include "pch.h"
#include "CppUnitTest.h"
#include "..\cpp-sample-lib\samplelib.h"

using namespace Microsoft::VisualStudio::CppUnitTestFramework;

namespace cppsampletest
{
    TEST_CLASS(cppsampletest)
    {
        public:

            TEST_METHOD(TestSumCorrect)
            {
                Assert::AreEqual(9, sum(4, 5));
            }

            TEST_METHOD(TestSumInCorrect)
            {
                Assert::AreEqual(10, sum(4, 5));
            }
    };
}
```

# Introduction to Code Reusability and Automate Testing

The screenshot shows a Visual Studio interface with two main windows. The top window is a code editor displaying `cpp-sample-test.cpp`. The code defines a class `cppsampletest` with two test methods: `TestSumCorrect` (passing) and `TestSumInCorrect` (failing). The bottom window is the Test Explorer, showing the execution results. It lists four tests: `cpp-sample-test` (2 failing), `cppsampletest` (2 failing), `TestSumCorrect` (passing), and `TestSumInCorrect` (failing with the message "Assert failed. Expected:<10> Actual:<9>").

# SampleLibraryTestClasss in NUnit Project

```
using csharp_sample_lib;
using NUnit.Framework;

namespace csharp_sample_lib_test
{
    public class SampleLibraryTestClass
    {
        sampleLibClass sampleLib;

        [SetUp]
        public void Setup()
        {
            sampleLib = new sampleLibClass();
        }

        [Test]
        public void testSayHelloTo()
        {
            Assert.AreEqual("Hello Computer", sampleLibClass.sayHelloTo("Computer"), "Regular say hello should work");
        }

        [Test]
        public void testSayHelloToWrong()
        {
            Assert.AreEqual("Hello All", sampleLibClass.sayHelloTo("Computer"), "Regular say hello won't work");
        }

        [Test]
        public void testSumCorrect()
        {
            Assert.AreEqual(9, sampleLibClass.sum(4, 5), "Regular sum should work");
        }

        [Test]
        public void testSumWrong()
        {
            Assert.AreEqual(10, sampleLibClass.sum(4, 5), "Regular sum shouldn't work");
        }

        [Test]
        public void testMultiply()
        {
            Assert.AreEqual(20, sampleLib.multiply(4, 5), "Regular multiplication should work");
        }
    }
}
```

# sample class library

```
using System;

namespace csharp_sample_lib
{
    public class sampleLibClass
    {
        public static string sayHelloTo(string name)
        {
            string result = String.Empty;

            if (!String.IsNullOrEmpty(name))
            {
                result = "Hello " + name;
            }
            else
            {
                result = "Hello There";
            }

            Console.WriteLine(result);

            return result;
        }

        public static int sum(int a, int b)
        {
            int c = 0;
            c = a + b;
            return c;
        }

        public int multiply(int a, int b)
        {
            return a * b;
        }
    }
}
```

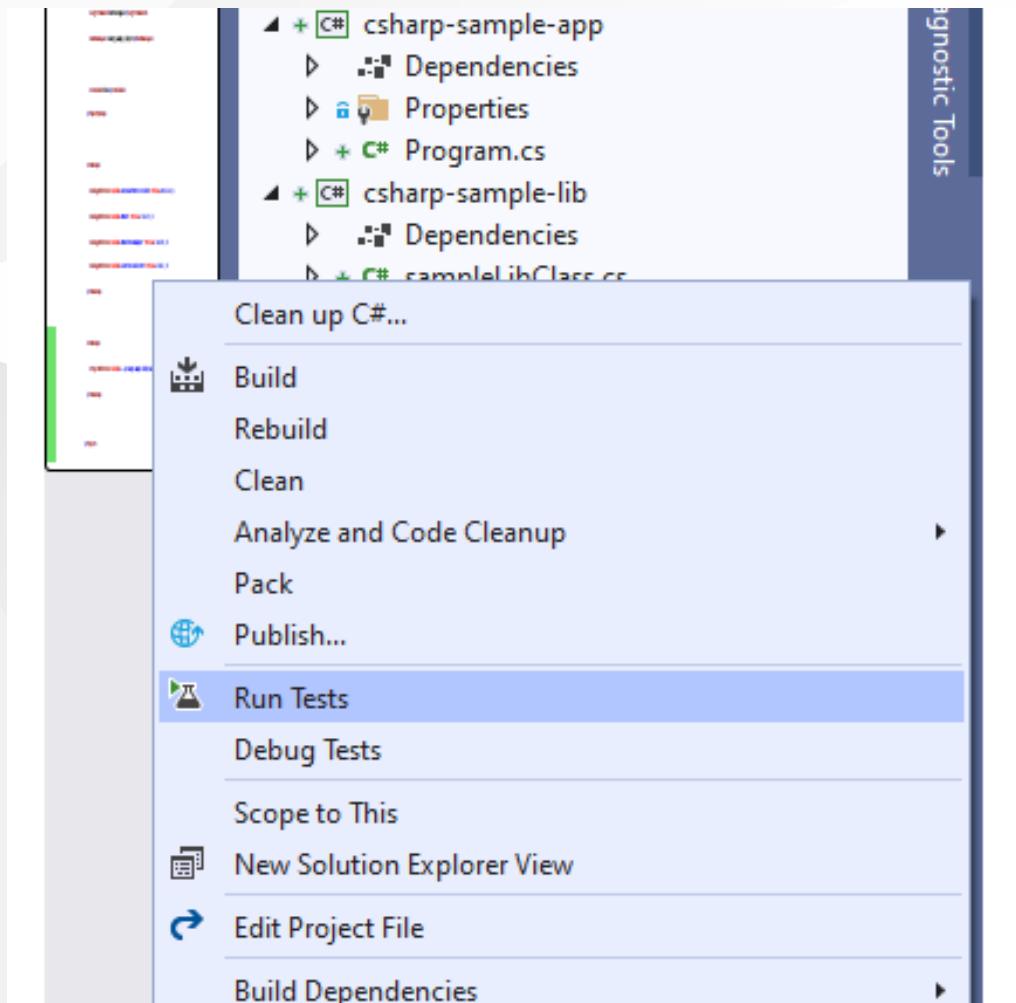

## Open test explorer and run tests

The screenshot shows the Visual Studio Test Explorer window. At the top, there are buttons for running tests (play/pause, stop, refresh) and a status bar indicating 'No issues found'. Below the toolbar is a table with columns: Test, Duration, Traits, and Error Message. The table lists the following test results:

Test	Duration	Traits	Error Message
✗ csharp-sample-lib-test (5)	71 ms		
✗ csharp_sample_lib_test (5)	71 ms		
✗ SampleLibraryTestClass (5)	71 ms		
✓ testMultiply	16 ms		
✓ testSayHelloTo	< 1 ms		
✗ testSayHelloToWrong	53 ms		Regular say hello won't work. Expected string length 9 but was 14. Strings differ at index 6. Expected: "Hello All" But was:....
✓ testSumCorrect	< 1 ms		
✗ testSumWrong	2 ms		Regular sum shouldn't work. Expected: 10. But was: 9

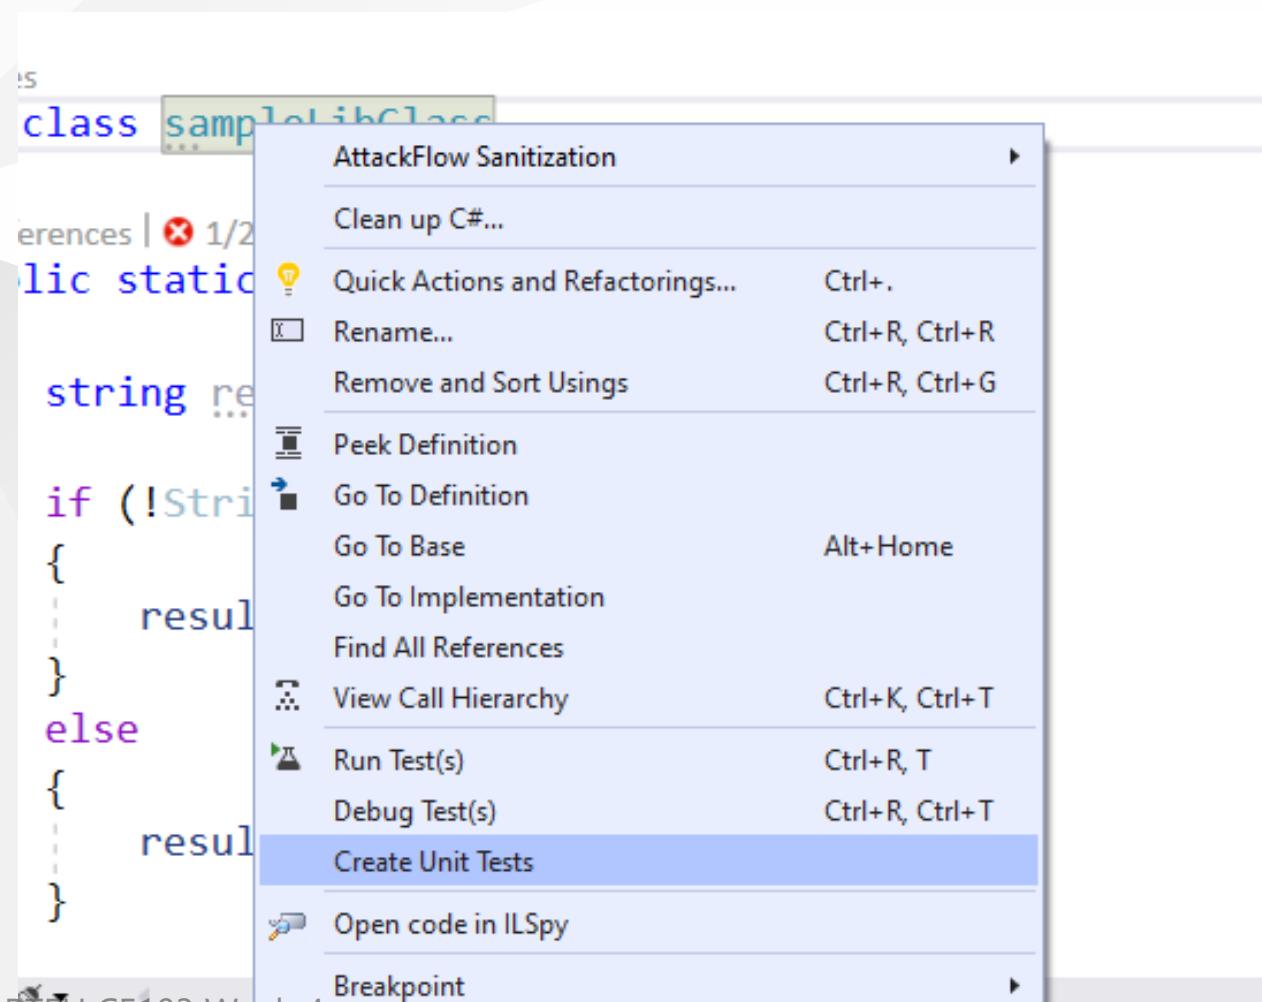

At the bottom of the window, tabs for Error List, Output, Find Symbol Results, and Test Explorer are visible. A watermark for 'ucoruh / ce103-algorithms-and-programming-1' is in the bottom right corner.

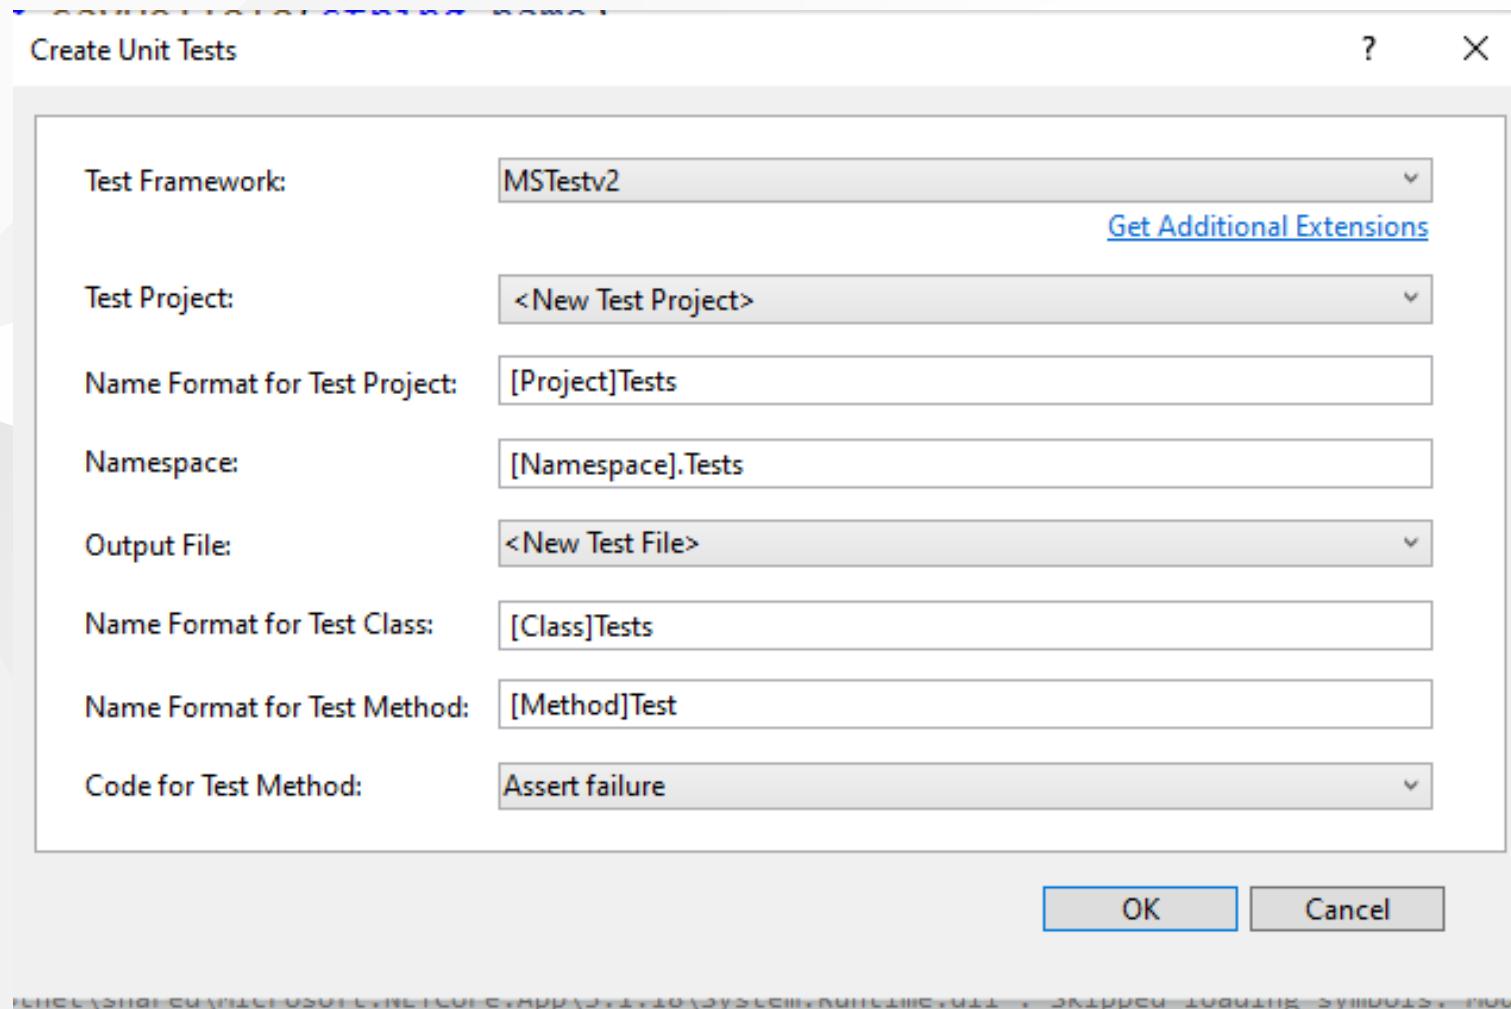

or you can run from project

Also we can create unit test from library class,

right click the sampleLibClass and select create unit tests but this option do not provide nunit tests.

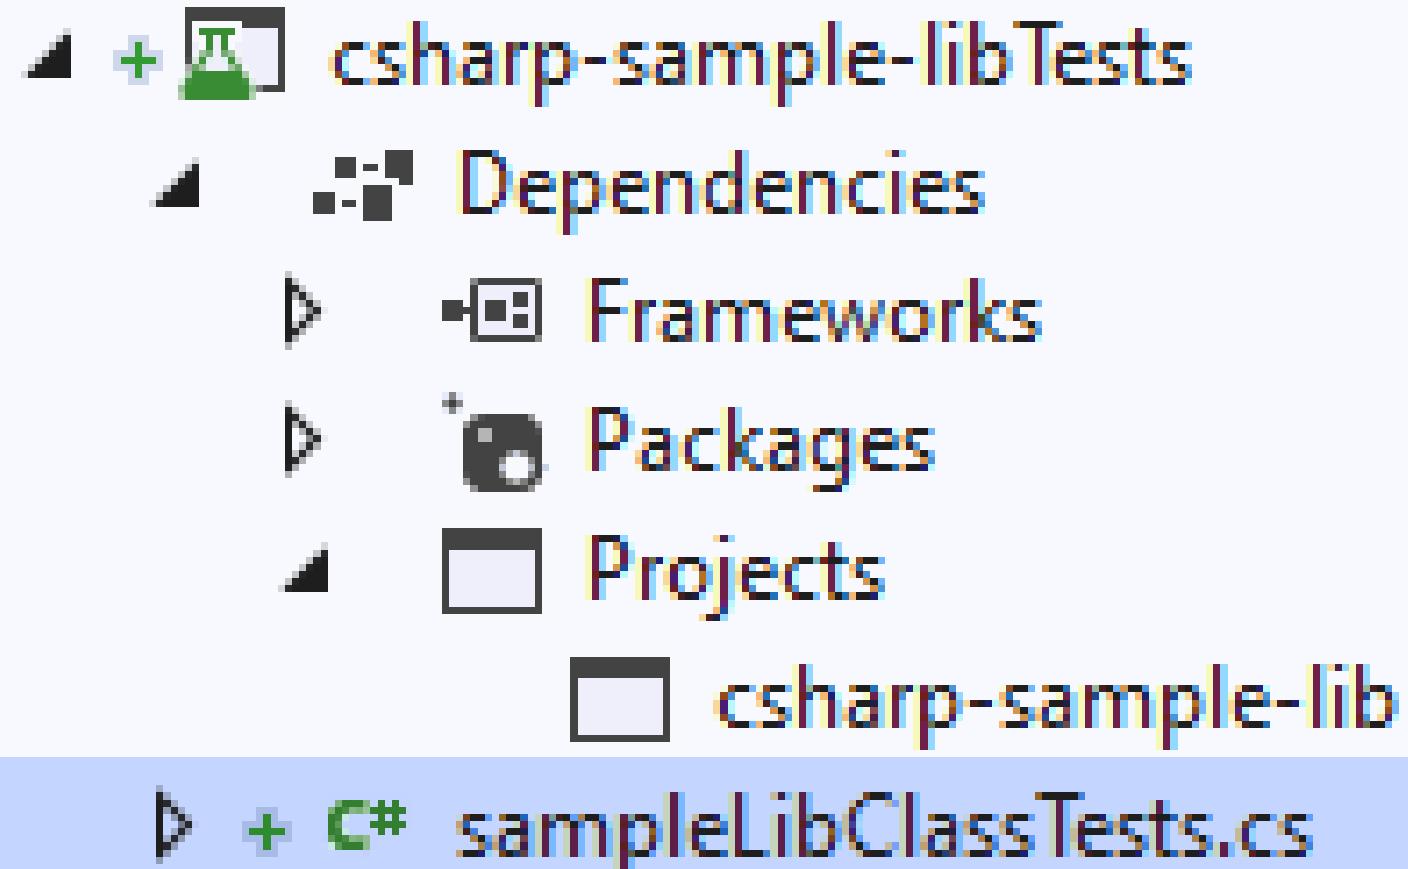

## Create Unit Tests

### Creating Unit Tests

```
using Microsoft.VisualStudio.TestTools.UnitTesting;
using csharp_sample_lib;
using System;
using System.Collections.Generic;
using System.Text;

namespace csharp_sample_lib.Tests
{
    [TestClass()]
    public class sampleLibClassTests
    {
        [TestMethod()]
        public void sayHelloToTest()
        {
            Assert.Fail();
        }

        [TestMethod()]
        public void sumTest()
        {
            Assert.Fail();
        }

        [TestMethod()]
        public void multiplyTest()
        {
            Assert.Fail();
        }
    }
}
```

we will not commit this changes and continue from nunit test project, the fine code coverage also work for nunit test but not provide inline highlighting if we run tests we will have the following outputs

```

1  using System;
2
3  namespace csharp_sample_lib
4  {
5      public class sampleLibClass
6      {
7          public static string sayHelloTo(string name)
8          {
9              string result = String.Empty;
10
11             if (!String.IsNullOrEmpty(name))
12             {
13                 result = "Hello " + name;
14             }
15             else
16             {
17                 result = "Hello There";
18             }
19         }
20     }
21 }

```

Analyzing code coverage in Visual Studio - DEV Community

RTEU CE103 Week-4

# TL;DR

Additional information you can use OpenCover + Nunit Runner + Report Generator together to setup a code coverage report but it has complex batch running process. After a few try I decided to use fine code coverage but here is the usage not tested well.

First unit test runner tool doesn't support .Net Core

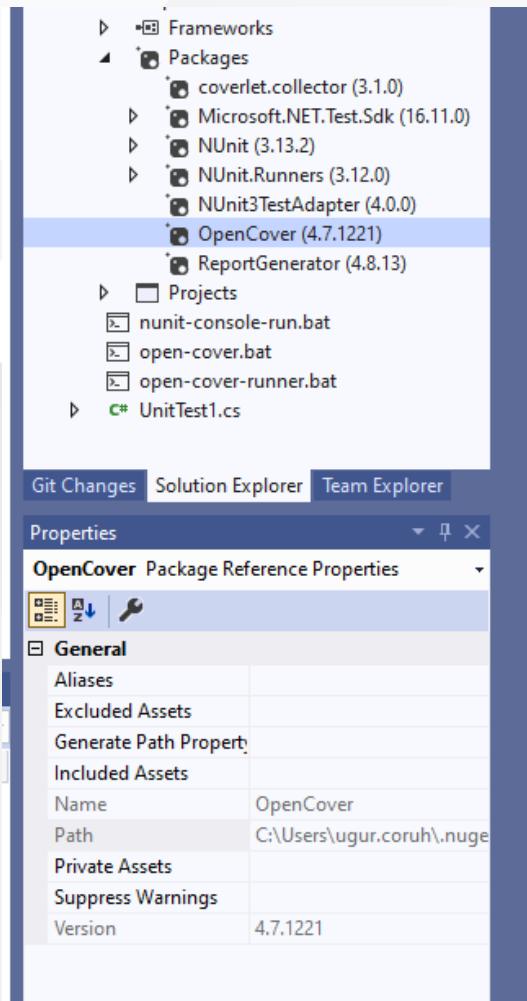

c# - The NUnit 3 driver encountered an error while executing reflected code  
([NUnit.Engine.NUnitEngineException](#)) - Stack Overflow

Follow the instructions on the link

[CMD OpenCover · sukhoi1/Useful-Notes Wiki · GitHub](#)

Install OpenCover, ReportGenerator, Nunit,Runners packages then use the package installation folder to get tools that you need

Here is a sample for open cover, select package and copy path

## Goto path and tools

```
C:\Users\ugur.coruh\.nuget\packages\opencover\4.7.1221
```

You need to setup some batch similar with following

run-test-coverage.bat

```
set pathA=C:\Users\ugur.coruh\.nuget\packages\opencover\4.7.1221\tools
set pathB=C:\Users\ugur.coruh\.nuget\packages\nunit.consolerunner\3.12.0\tools
set pathC=C:\Users\ugur.coruh\.nuget\packages\reportgenerator\4.8.13\tools\netcoreapp3.0
set dllpath=C:\Users\ugur.coruh\Desktop\csharp-sample-lib\csharp-sample-lib-test\bin\Debug\netcoreapp3.1

"%pathA%\OpenCover.Console.exe" ^
-targetargs:"%dllpath%\csharp-sample-lib-test.dll" ^
-filter:"+[csharp-sample-lib]* -[*test]*" ^
-target:"%pathB%\nunit3-console.exe" ^
-output:"%dllpath%\coverReport.xml" ^
-skipautoprops -register:user && "%pathC%\ReportGenerator.exe" -reports:"%dllpath%\coverReport.xml" -targetdir:"%dllpath%\coverage"
pause
```

## but nunit3-console.exe gives error

```
C:\Users\supur\Desktop\csharp-sample-1.0>C:\Users\supur\csharp\ NUnit\packages\nunit-console\4.1.221\start\OpenCover.Console.exe --target:"C:\Users\supur\csharp\Debug\sample-1.0\Debug\sample-1.0\test\bin\Debug\sample-1.0\test\lib\test.dll" --filter:"!csharp-sample*!*" --target:"C:\Users\supur\csharp\sample-1.0\test\bin\Debug\sample-1.0\test\lib\test.dll" --output:"C:\Users\supur\Desktop\csharp-sample-1.0\test\bin\Debug\sample-1.0\test\lib\test\coverageapp1.coverage" --reporter:"C:\Users\supur\Desktop\csharp-sample-1.0\test\bin\Debug\sample-1.0\test\lib\test\coverageapp1.coverage"

# ReportGenerator

Release ReportGenerator\_4.8.13 · danielpalme/ReportGenerator · GitHub

The screenshot shows the GitHub release page for the 'ReportGenerator\_4.8.13' release. At the top, it displays the title 'ReportGenerator\_4.8.13' and a 'Latest' button. Below the title, it shows the release was made by 'github-actions' 27 days ago, with 4 commits to master since the release. The version is v4.8.13, commit hash e552cc6, and a green checkmark icon indicates it's a verified release. A note below states 'This release requires .NET 4.7 or .NET Core 2.x/3.x/5.x.' Under the 'Changes:' section, there are three bullet points: #441: Added method coverage to reports, #445: Added support for better custom logging, and #450: Conditional file numbers in class report. The 'Assets' section lists three files: 'ReportGenerator\_4.8.13.zip' (13.2 MB), 'Source code (zip)', and 'Source code (tar.gz)'. A small smiley face icon is at the bottom left.

ReportGenerator\_4.8.13 Latest

github-actions released this 27 days ago · 4 commits to master since this release · v4.8.13 · e552cc6 ✓

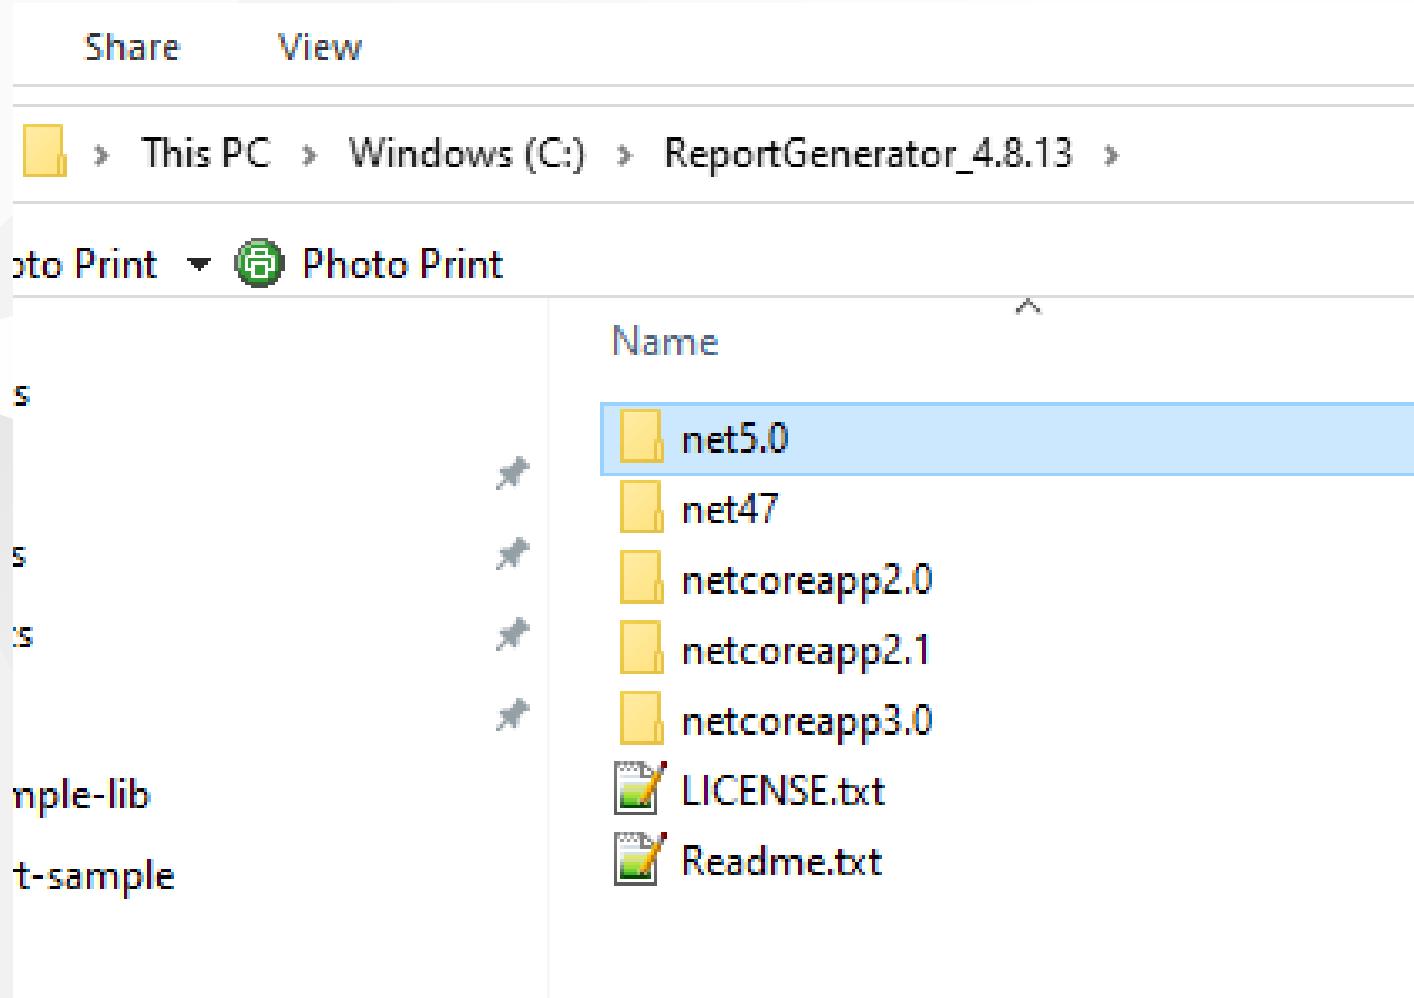

This release requires .NET 4.7 or .NET Core 2.x/3.x/5.x.

**Changes:**

- #441: Added method coverage to reports
- #445: Added support for better custom logging
- #450: Conditional file numbers in class report

# NUnit Console

## Downloads

The screenshot shows the 'Downloads' section of the NUnit website. At the top, there's a navigation bar with links for News, Download, Documentation, Contact, Twitter, Slack, and GitHub. Below this is a large heading 'Downloads' with a download icon. To the left, under 'Download Types', it says 'The preferred way to download NUnit is through the [NuGet](#) package manager.' and 'The latest releases can always be found on the relevant GitHub releases pages.' On the right, there are two tables of 'Latest Releases'. The first table is for 'Latest NUnit 3 Releases' and lists:

Release	Date
NUnit 3.13.2	April 27, 2021
NUnit Console 3.12	January 17, 2021
NUnit Test Adapter 3.17	July 11, 2020
NUnit Test Generator 2.3	September 20, 2019
NUnit 3 Template for dotnet new CLI	

The second table is for 'Latest NUnit 2 Release' and lists:

Release	Date
NUnit 2.7.1	August 19, 2019
NUnit Test Adapter 2.2	June 5, 2019

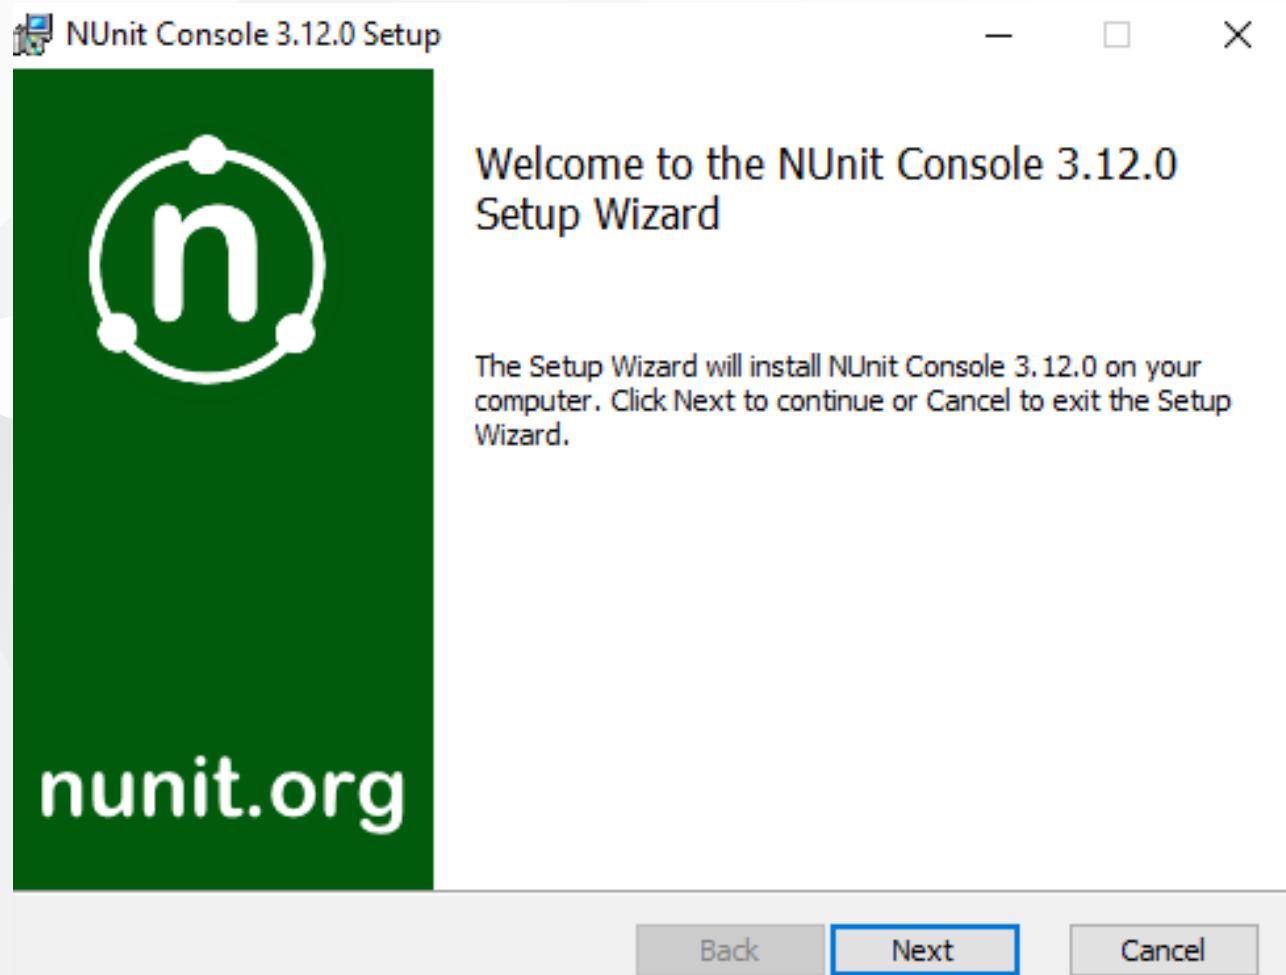

## Older Releases

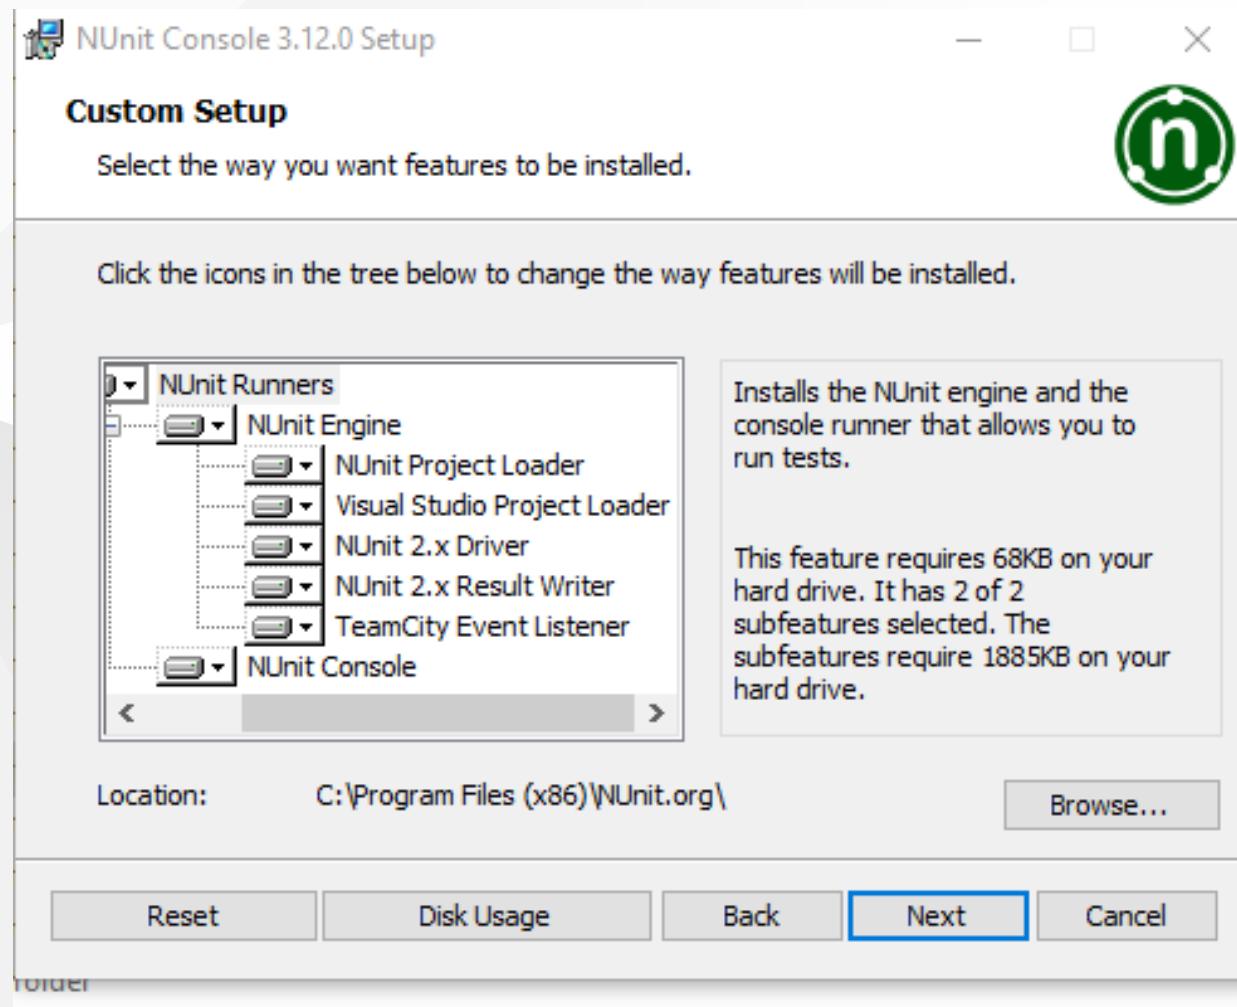

These releases are needed by many people for legacy work, so we keep them around for download. Bugs are accepted on older releases only if they can be reproduced on a current release.

# Java Application + JUnit

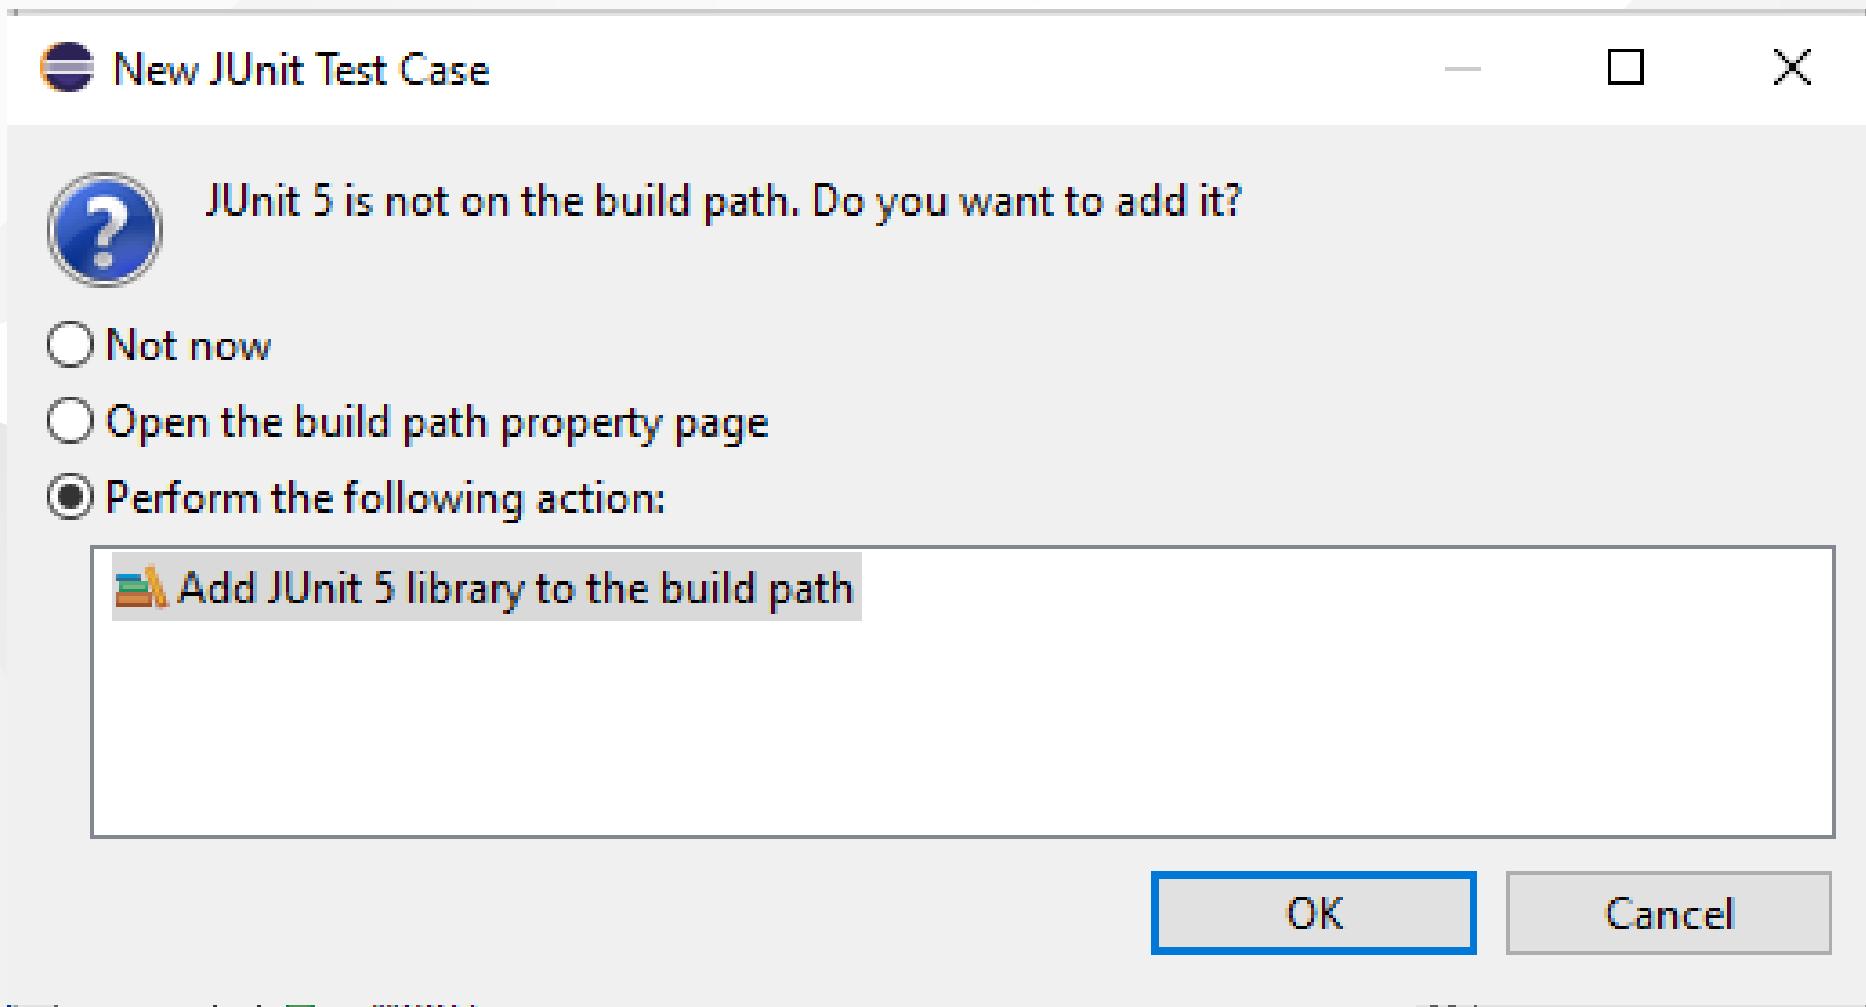

In normal java application we can right click the project java-sample-lib and add Junit case

and you will have the following test class

The screenshot shows the Eclipse IDE interface with the following details:

- Package Explorer View:** Shows the project structure:
  - java-sample-app
  - java-sample-lib
    - JRE System Library [JavaSE-16]
    - src
      - ce103
        - JavaSampleLib.java
        - JavaSampleLibTest.java
  - JUnit 5
  - java-sample-lib-test
- Editor View:** Displays the code for `JavaSampleLibTest.java`. The code is a JUnit 5 test class with several annotations and methods.

```
1 package ce103;
2
3 import static org.junit.jupiter.api.Assertions.*;
4
5 class JavaSampleLibTest {
6
7     @BeforeAll
8     static void setUpBeforeClass() throws Exception {
9
10    }
11
12     @AfterAll
13     static void tearDownAfterClass() throws Exception {
14
15    }
16
17     @BeforeEach
18     void setUp() throws Exception {
19
20    }
21
22     @AfterEach
23     void tearDown() throws Exception {
24
25    }
26
27     @Test
28     void testSum() {
29         fail("Not yet implemented");
30     }
31
32     @Test
33     void testMain() {
34         fail("Not yet implemented");
35     }
36
37 }
38
39 }
40 }
```

# We need to cover all code branches that we coded

I have updated JavaSampleLib.java as follow to check outputs

## JavaSampleLib.java

```
package ce103;

public class JavaSampleLib {

    public static String sayHelloTo(String name) {
        String output = "";
        if(!name.isBlank() && !name.isEmpty()){
            output = "Hello "+name;
        }else {
            output = "Hello There";
        }
        System.out.println(output);
        return output;
    }

    public static int sum(int a,int b)
    {
        int c = 0;
        c = a+b;
        return c;
    }

    public int multiply(int a, int b) {
        return a * b;
    }

    //    public static void main(String[] args) {
    //        // TODO Auto-generated method stub
    //        System.out.println("Hello World!");
    //
    //        JavaSampleLib.sayHelloTo("Computer");
    //        int result = JavaSampleLib.sum(5, 4);
    //        System.out.println("Results is" + result);
    //        System.out.printf("Results is %d \n", result);
    //
    //        try {
    //            System.in.read();
    //        } catch (IOException e) {
    //            // TODO Auto-generated catch block
    //            e.printStackTrace();
    //        }
    //    }
}
```

# Introduction to Code Reusability and Automate Testing and JavaSampleLibTest.java

```
package ce103;

import static org.junit.jupiter.api.Assertions.*;

import org.junit.jupiter.api.AfterAll;
import org.junit.jupiter.api.AfterEach;
import org.junit.jupiter.api.BeforeAll;
import org.junit.jupiter.api.DisplayName;
import org.junit.jupiter.api.RepeatedTest;
import org.junit.jupiter.api.Test;
import org.junit.jupiter.params.ParameterizedTest;
import org.junit.jupiter.params.provider.MethodSource;

class JavaSampleLibTest {

    JavaSampleLib sampleLib;

    @BeforeAll
    static void setUpBeforeClass() throws Exception {
    }

    @AfterAll
    static void tearDownAfterClass() throws Exception {
    }

    @BeforeEach
    void setUp() throws Exception {
        sampleLib = new JavaSampleLib();
    }

    @AfterEach
    void tearDown() throws Exception {
    }

    @Test
    @DisplayName("Simple Say Hello should work")
    void testSayHelloTo() {
        assertEquals("Hello Computer", JavaSampleLib.sayHelloTo("Computer"), "Regular say hello should work");
    }

    @Test
    @DisplayName("Simple Say Hello shouldn't work")
    void testSayHelloToWrong() {
        assertEquals("Hello All", JavaSampleLib.sayHelloTo("Computer"), "Regular say hello won't work");
    }

    @Test
    @DisplayName("Simple sum should work")
    void testSumCorrect() {
        assertEquals(9, JavaSampleLib.sum(4, 5), "Regular sum should work");
    }

    @Test
    @DisplayName("Simple sum shouldn't work")
    void testSumWrong() {
        assertEquals(10, JavaSampleLib.sum(4, 5), "Regular sum shouldn't work");
    }

    @Test
    @DisplayName("Simple multiplication should work")
    void testMultiply() {
        assertEquals(20, sampleLib.multiply(4, 5), "Regular multiplication should work");
    }

    @RepeatedTest(5)
    @DisplayName("Ensure correct handling of zero")
    void testMultiplyWithZero() {
        assertEquals(0, sampleLib.multiply(0, 5), "Multiple with zero should be zero");
        assertEquals(0, sampleLib.multiply(5, 0), "Multiple with zero should be zero");
    }

    public static int[][] data() {
        return new int[][]{ { 1, 2, 2 }, { 5, 3, 15 }, { 121, 4, 484 }, { 2, 2, 2 } };
    }

    @ParameterizedTest
    @MethodSource(value = "data")
    void testWithStringParameter(int[] data) {
        JavaSampleLib tester = new JavaSampleLib();
        int m1 = data[0];
        int m2 = data[1];
        int expected = data[2];
        assertEquals(expected, tester.multiply(m1, m2));
    }
}
```

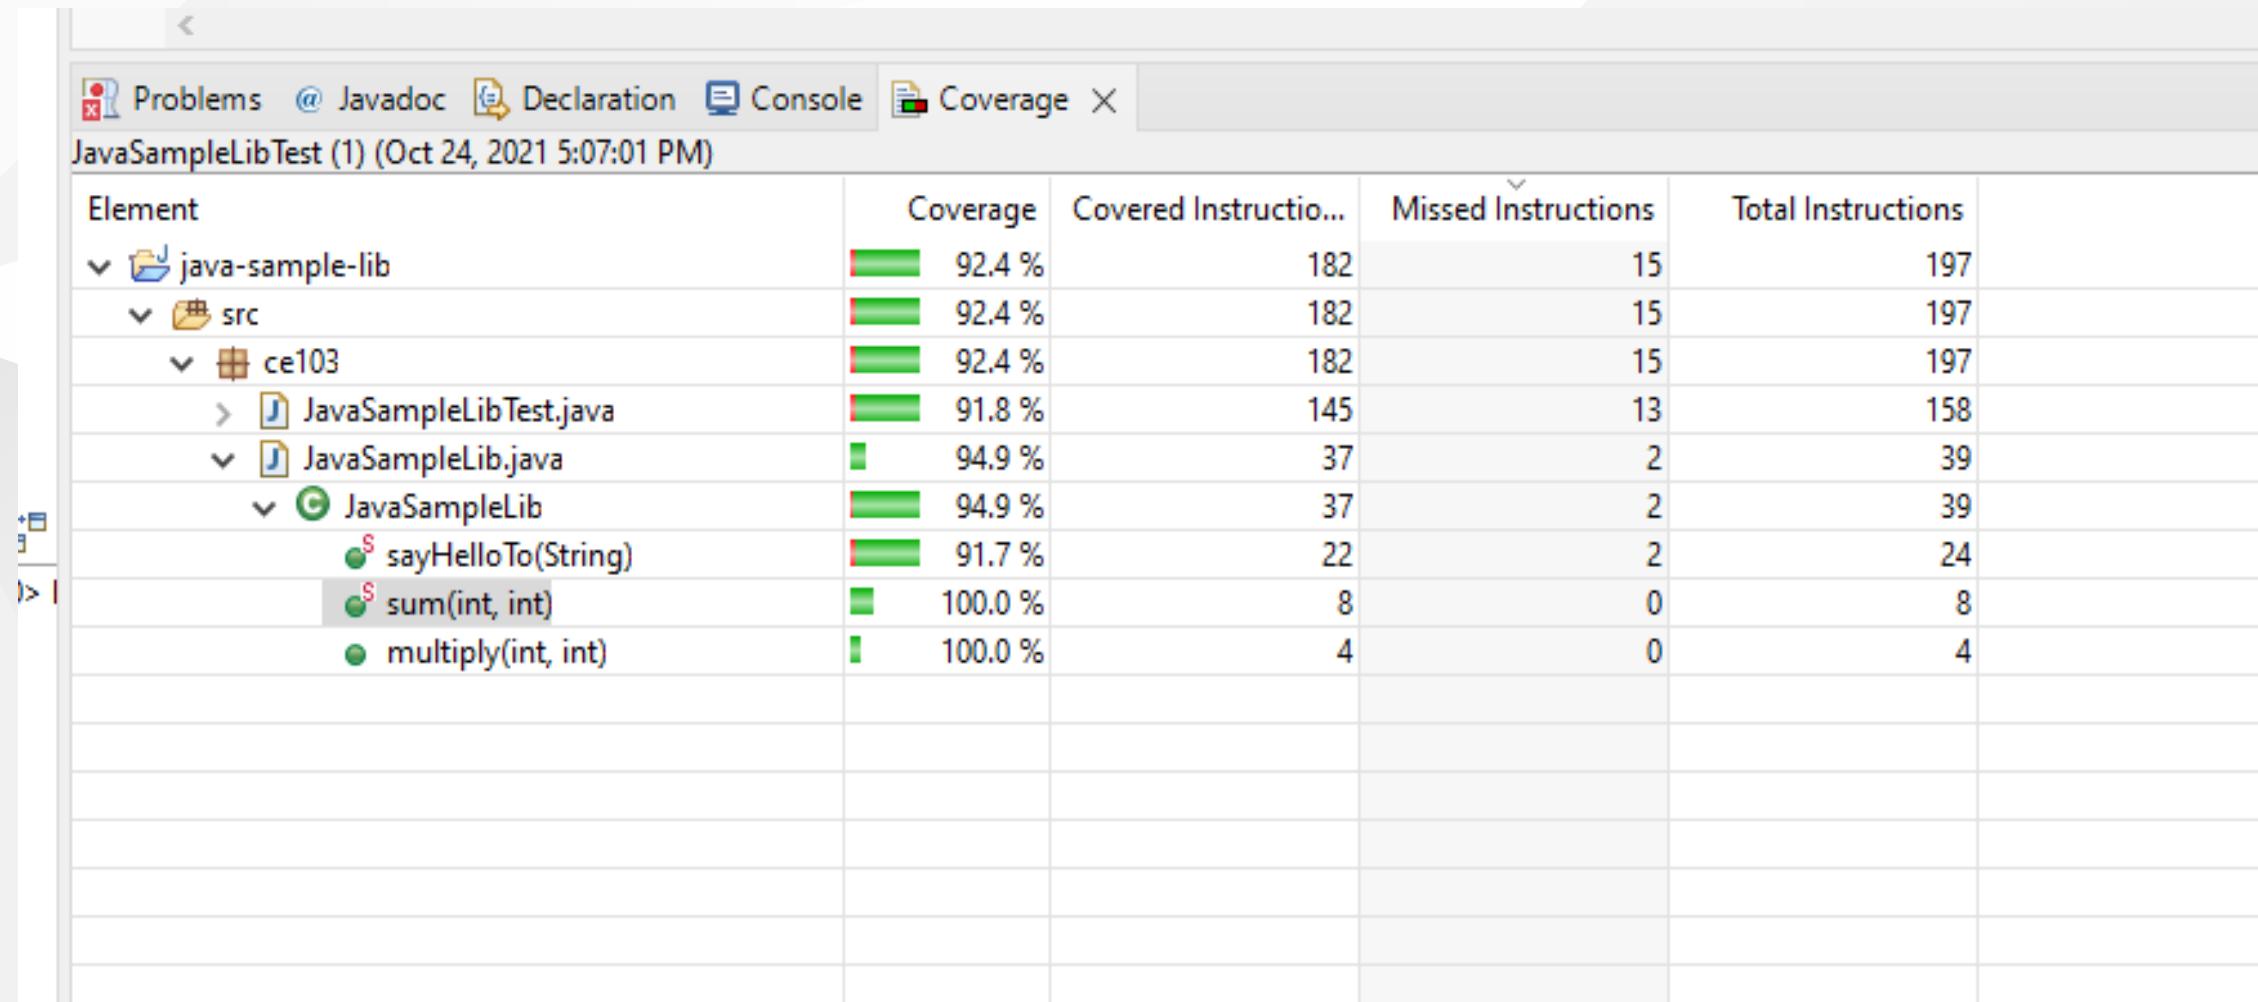

## if we run tests

we will see all results there

also we can see the code coverage of tests

when we open our source code (just close and open again another case highlighting will not work) you will see tested part of your codes

```
1 package ce103;
2
3 public class JavaSampleLib {
4
5     public static String sayHelloTo(String name) {
6
7         String output = "";
8
9         if(!name.isBlank() && !name.isEmpty()){
10             output = "Hello "+name;
11         }else {
12             output = "Hello There";
13         }
14
15         System.out.println(output);
16
17         return output;
18     }
19
20     public static int sum(int a,int b)
21     {
22         int c = 0;
23         c = a+b;
24         return c;
25     }
26
27     public int multiply(int a, int b) {
28         return a * b;
29     }
30 }
```

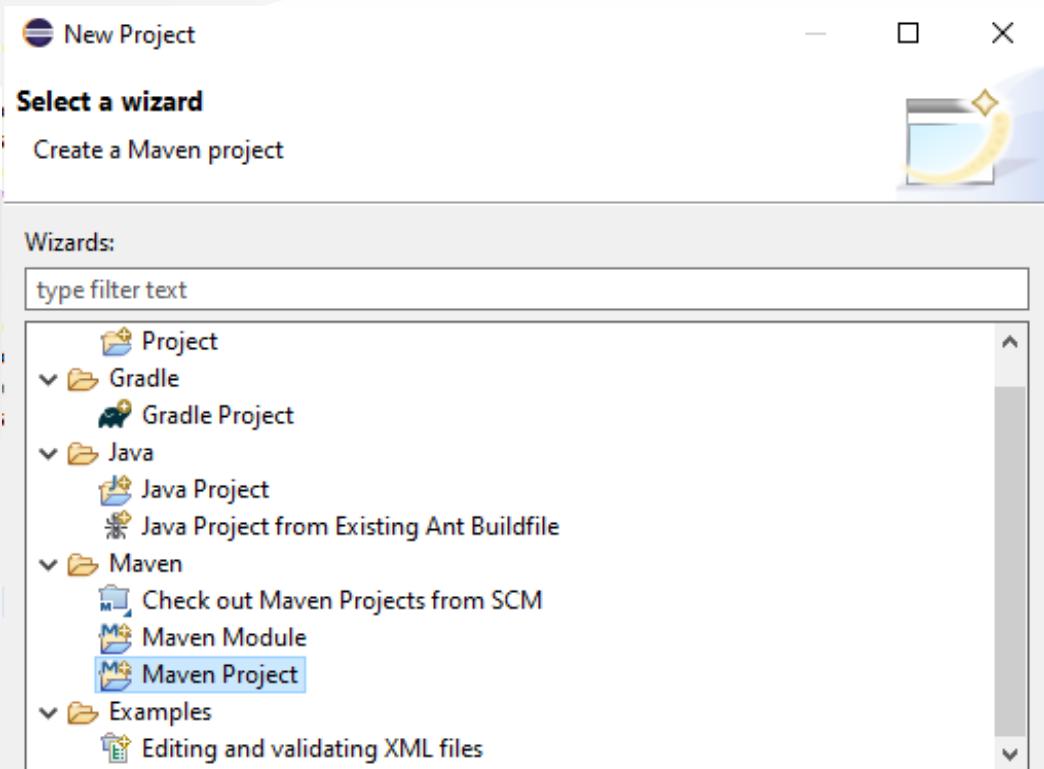

# Maven Java Application + JUnit

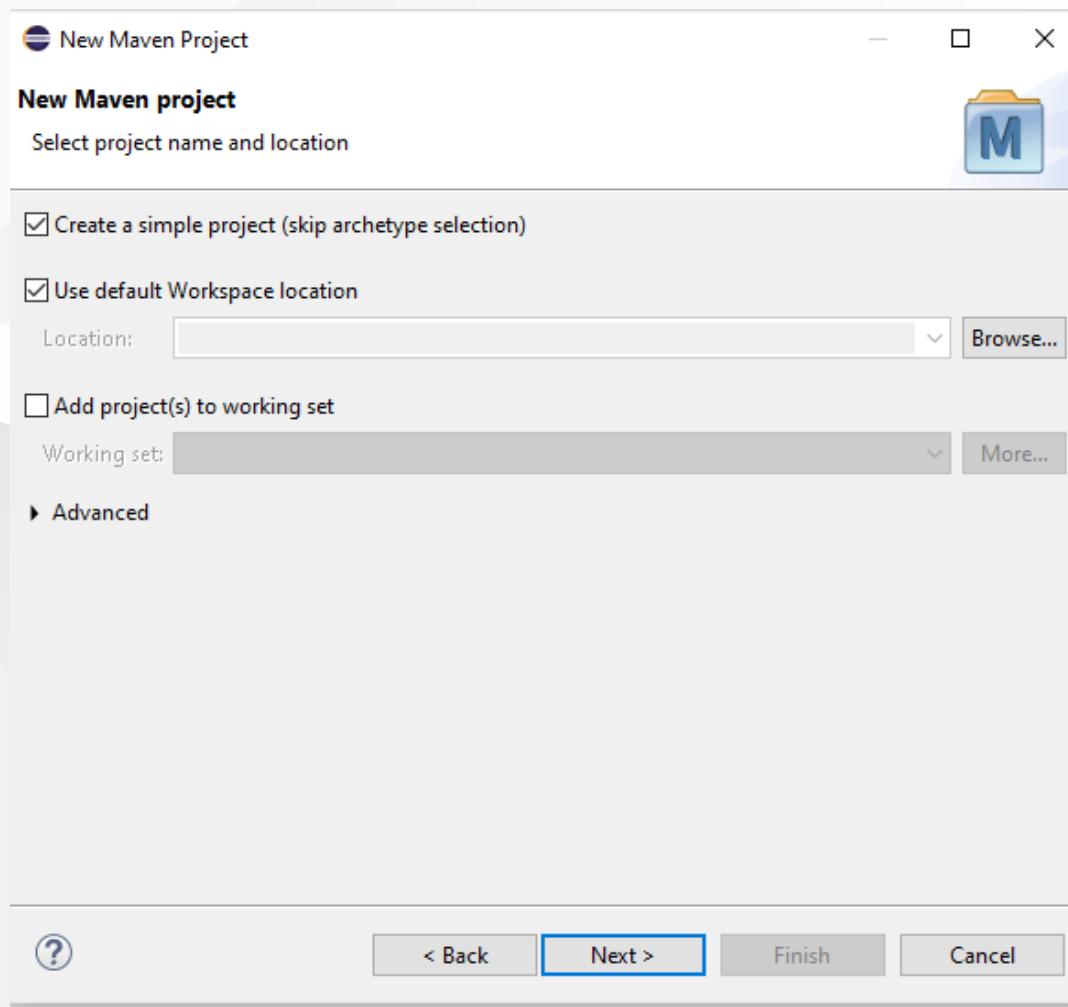

Introduction to Code Reusability and Automate Testing

Lets create Maven project with tests

Create a maven project

*File -> New -> Maven Project*

Lets convert our sample java-sample-lib directories to standard folder structure for test and app division

[Maven – Introduction to the Standard Directory Layout](#)

Also for intro you can use this

[JUnit Hello World Example - Examples Java Code Geeks - 2021](#)

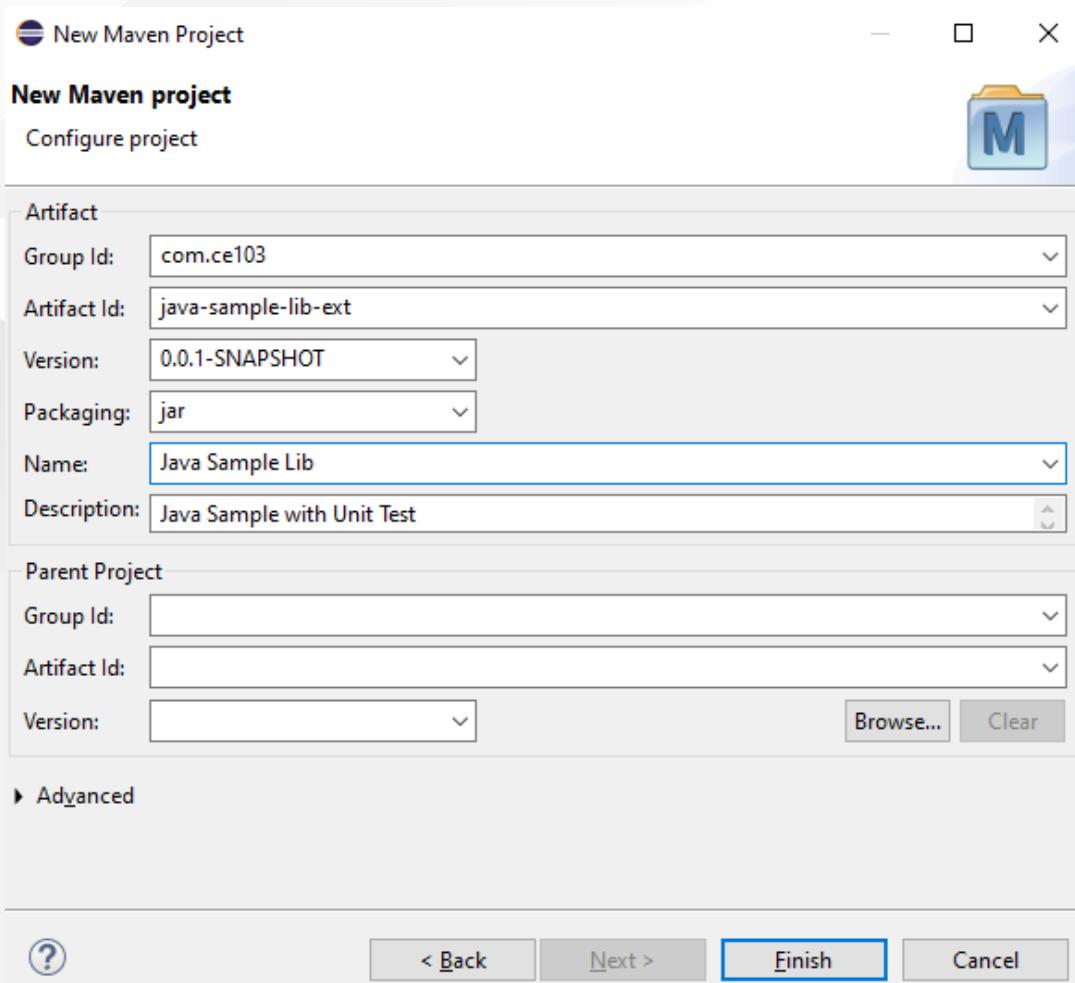

Eclipse

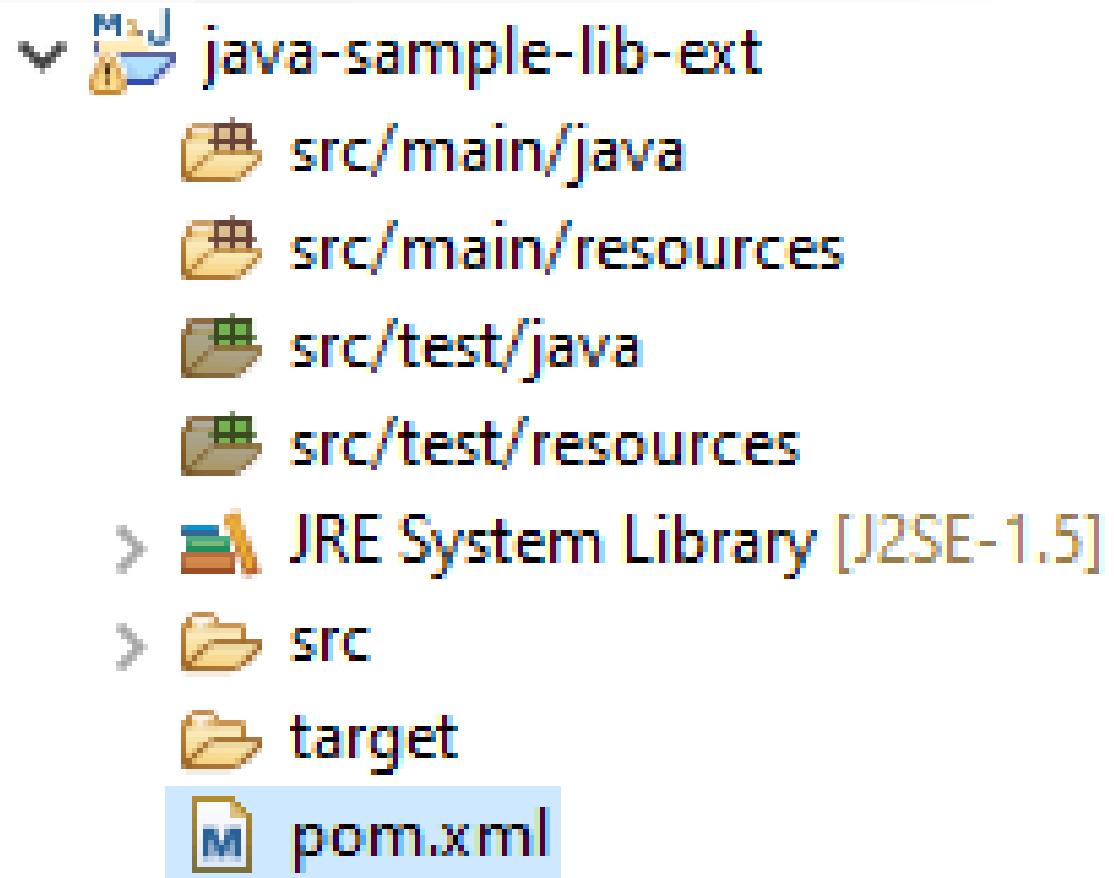

Maven

Java

JUnit 4.12 (pulled by Maven automatically)

Lets give new sample java-sample-lib-mvnbut in this time we will create a maven project

## pom.xml file

```
<project xmlns="http://maven.apache.org/POM/4.0.0" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:schemaLocation="http://maven.apache.org/POM/4.0.0 https://maven.apache.org/xsd/maven-4.0.0.xsd">
  <modelVersion>4.0.0</modelVersion>
  <groupId>com.ce103</groupId>
  <artifactId>java-sample-lib-ext</artifactId>
  <version>0.0.1-SNAPSHOT</version>
  <name>Java Sample Lib</name>
  <description>Java Sample with Unit Test</description>
</project>
```

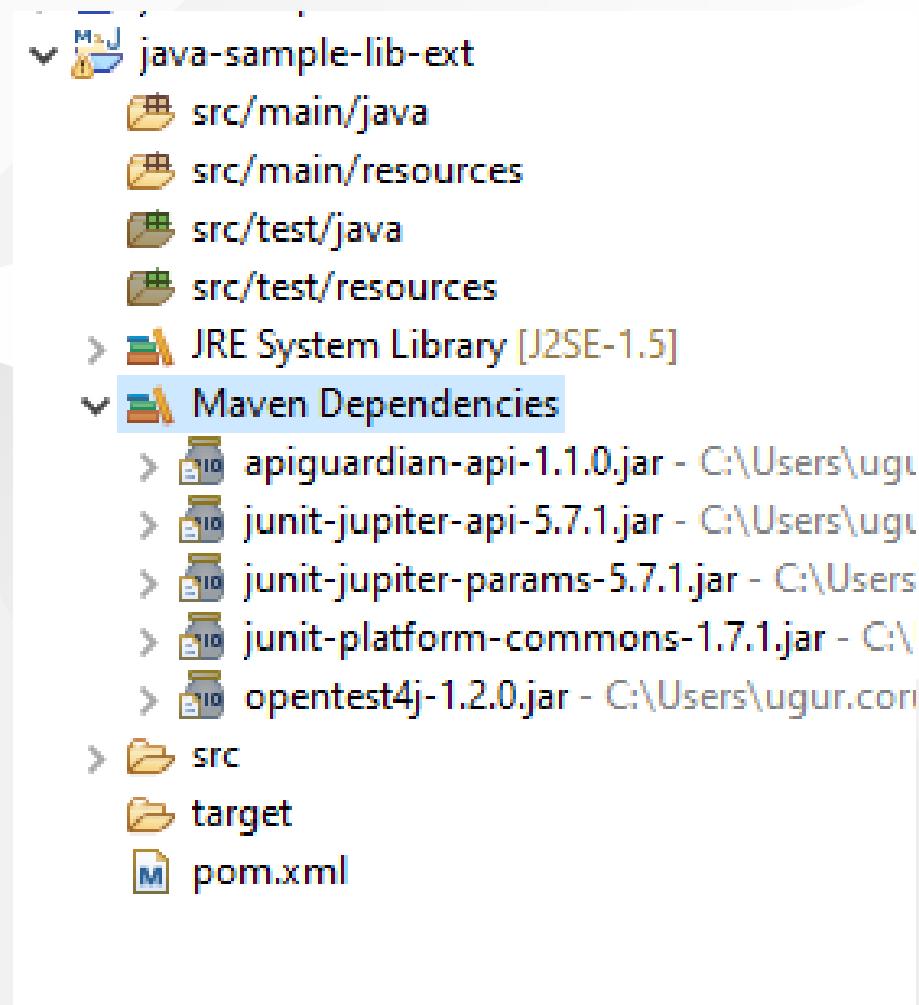

we will add JUnit 5 for our project

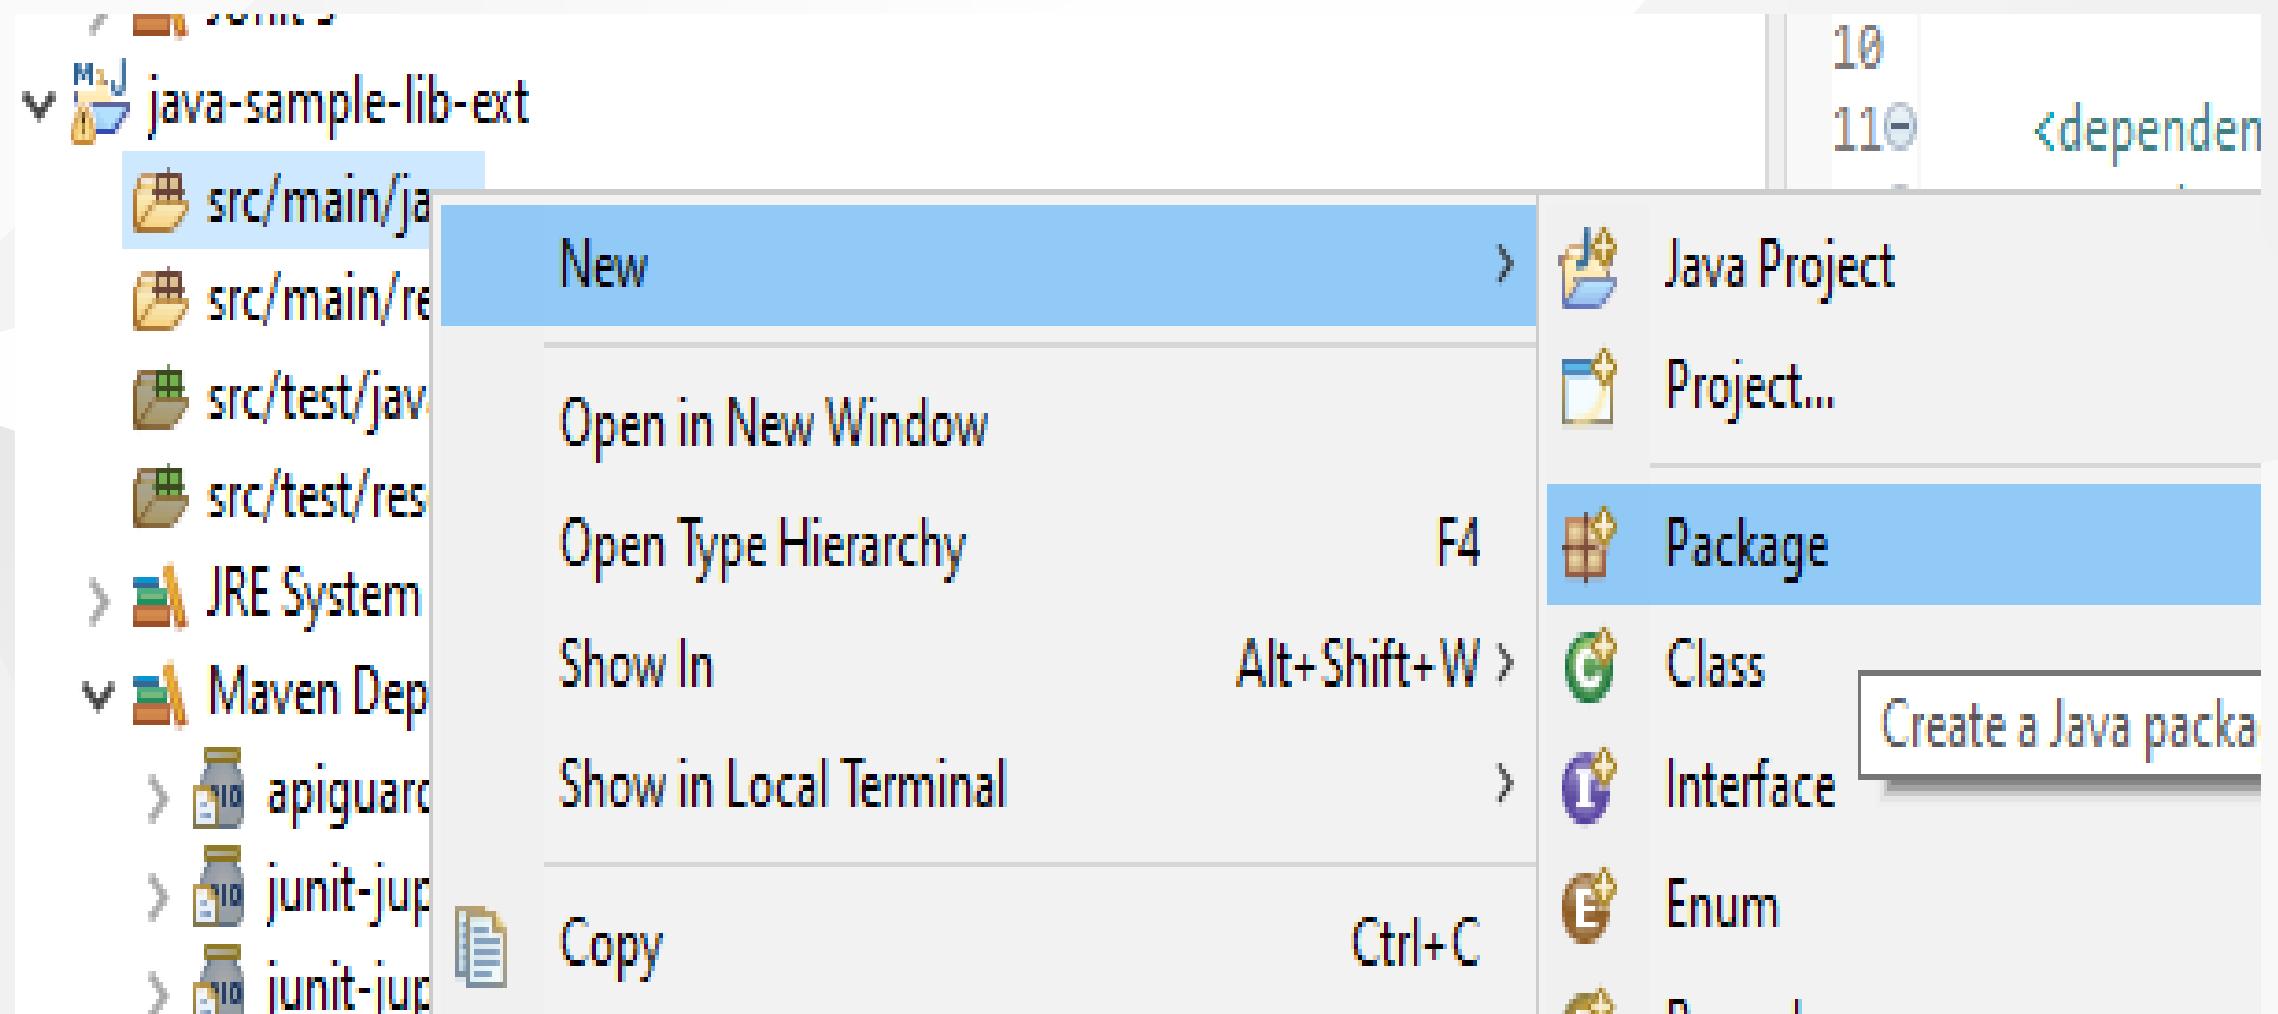

```
<project xmlns="http://maven.apache.org/POM/4.0.0"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://maven.apache.org/POM/4.0.0 https://maven.apache.org/xsd/maven-4.0.0.xsd">
  <modelVersion>4.0.0</modelVersion>
  <groupId>com.ce103</groupId>
  <artifactId>java-sample-lib-ext</artifactId>
  <version>0.0.1-SNAPSHOT</version>
  <name>Java Sample Lib</name>
  <description>Java Sample with Unit Test</description>

  <dependencies>
    <dependency>
      <groupId>org.junit.jupiter</groupId>
      <artifactId>junit-jupiter-params</artifactId>
      <version>5.7.1</version>
      <scope>test</scope>
    </dependency>
  </dependencies>

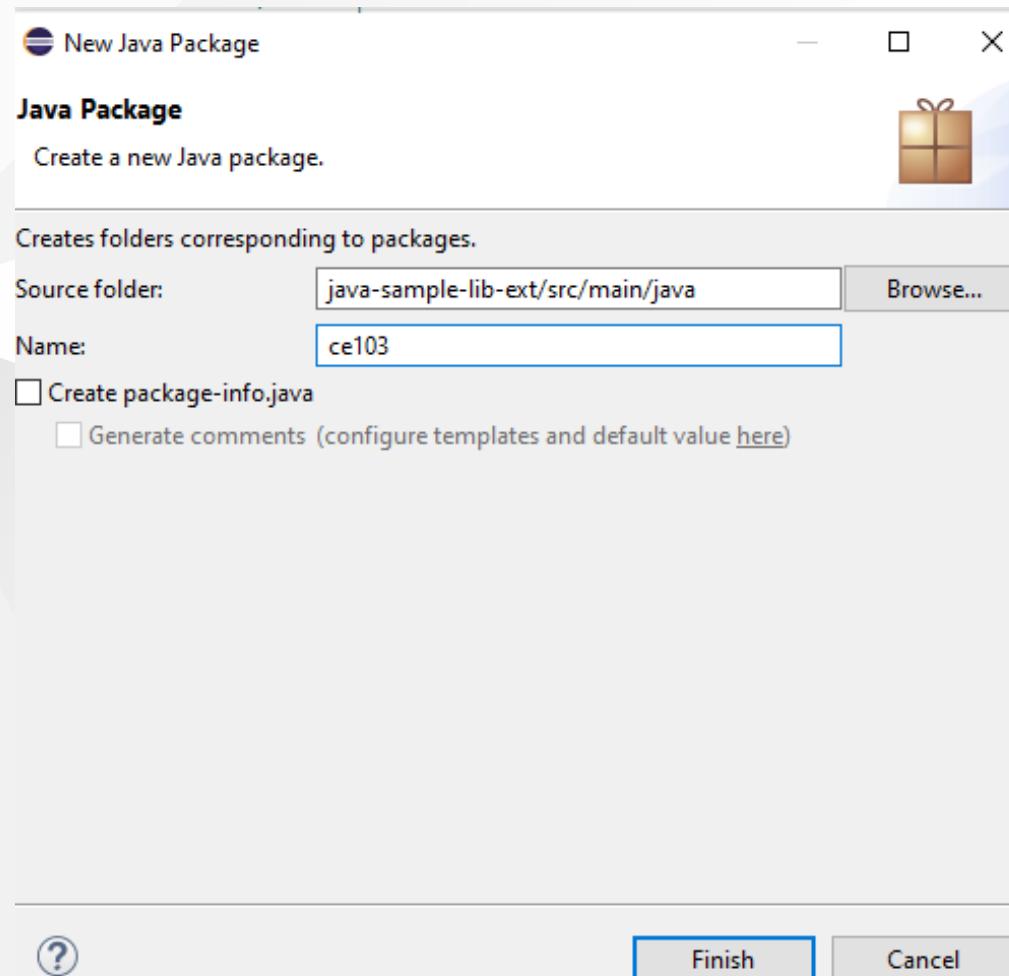

</project>
```

it will automatically download libraries

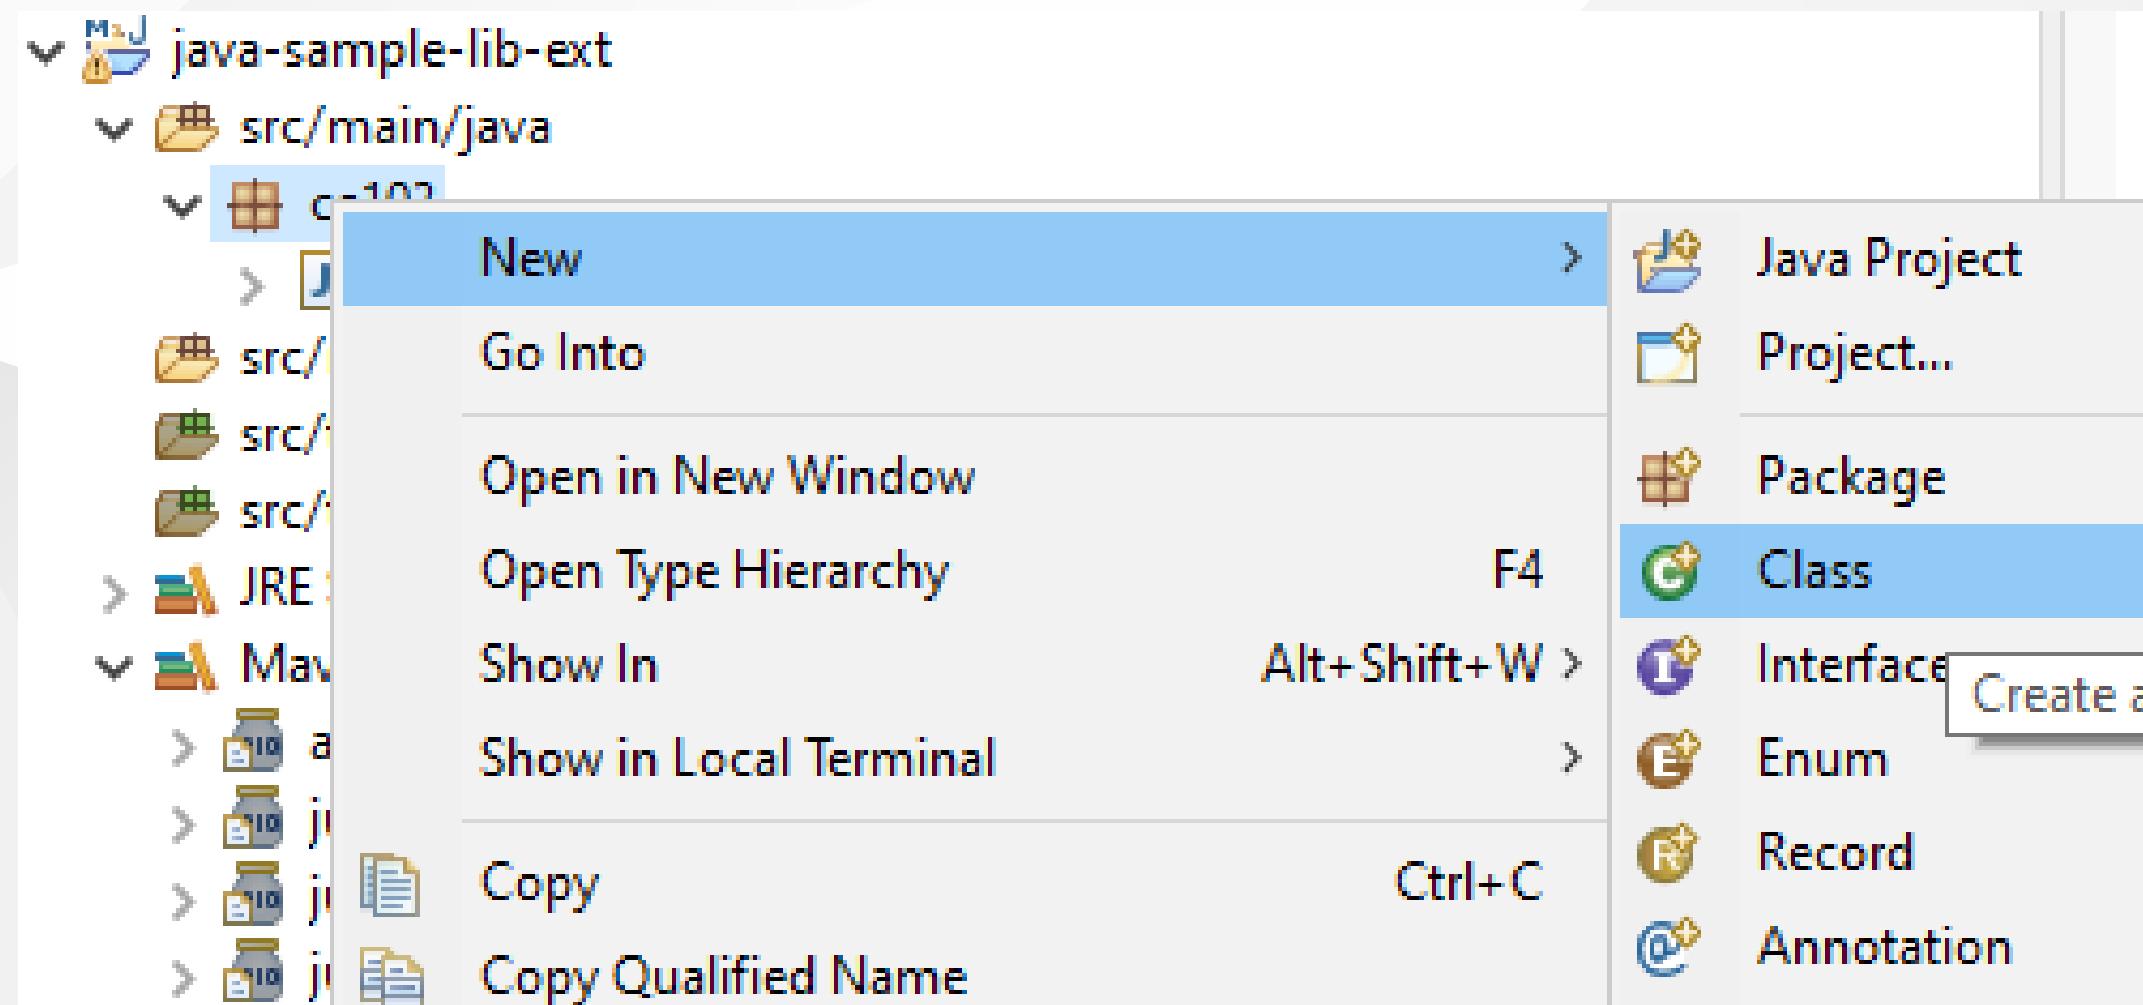

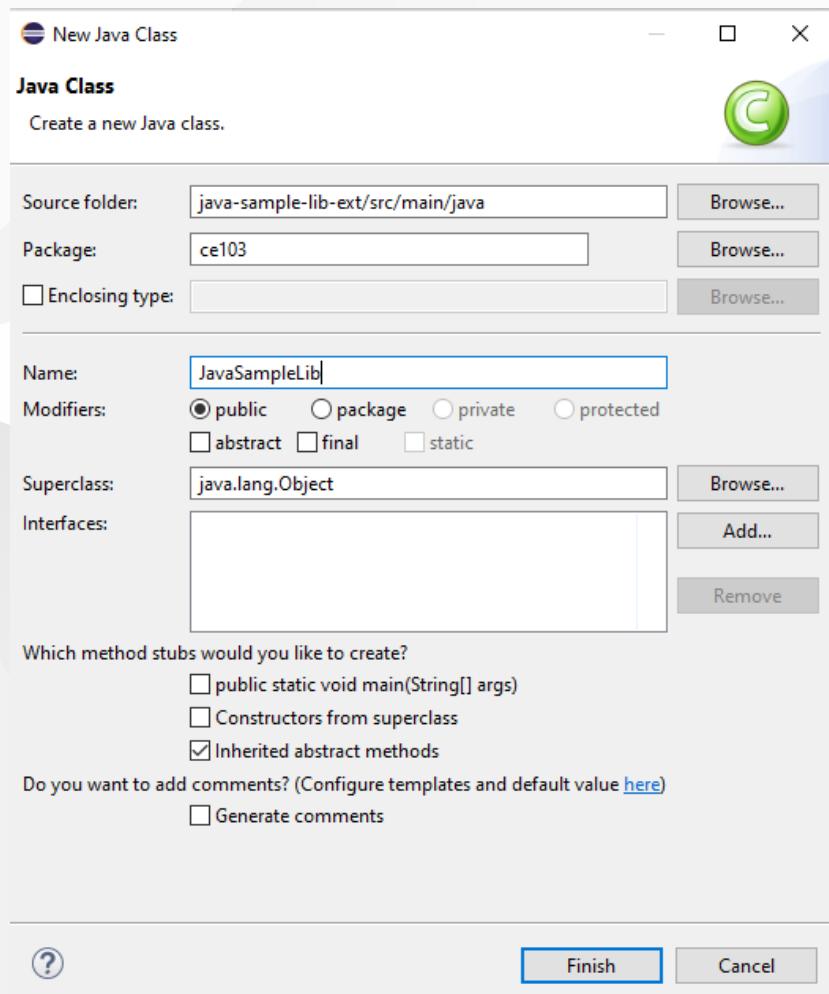

## Create java sample library in ce103 package, first create java package

In this package create library class

## copy content from other library

```
package ce103;

public class JavaSampleLib {

    public static String sayHelloTo(String name) {

        String output = "";

        if(!name.isBlank() && !name.isEmpty()){
            output = "Hello "+name;
        }else {
            output = "Hello There";
        }

        System.out.println(output);

        return output;
    }

    public static int sum(int a,int b)
    {
        int c = 0;
        c = a+b;
        return c;
    }

    public int multiply(int a, int b) {
        return a * b;
    }

}
```

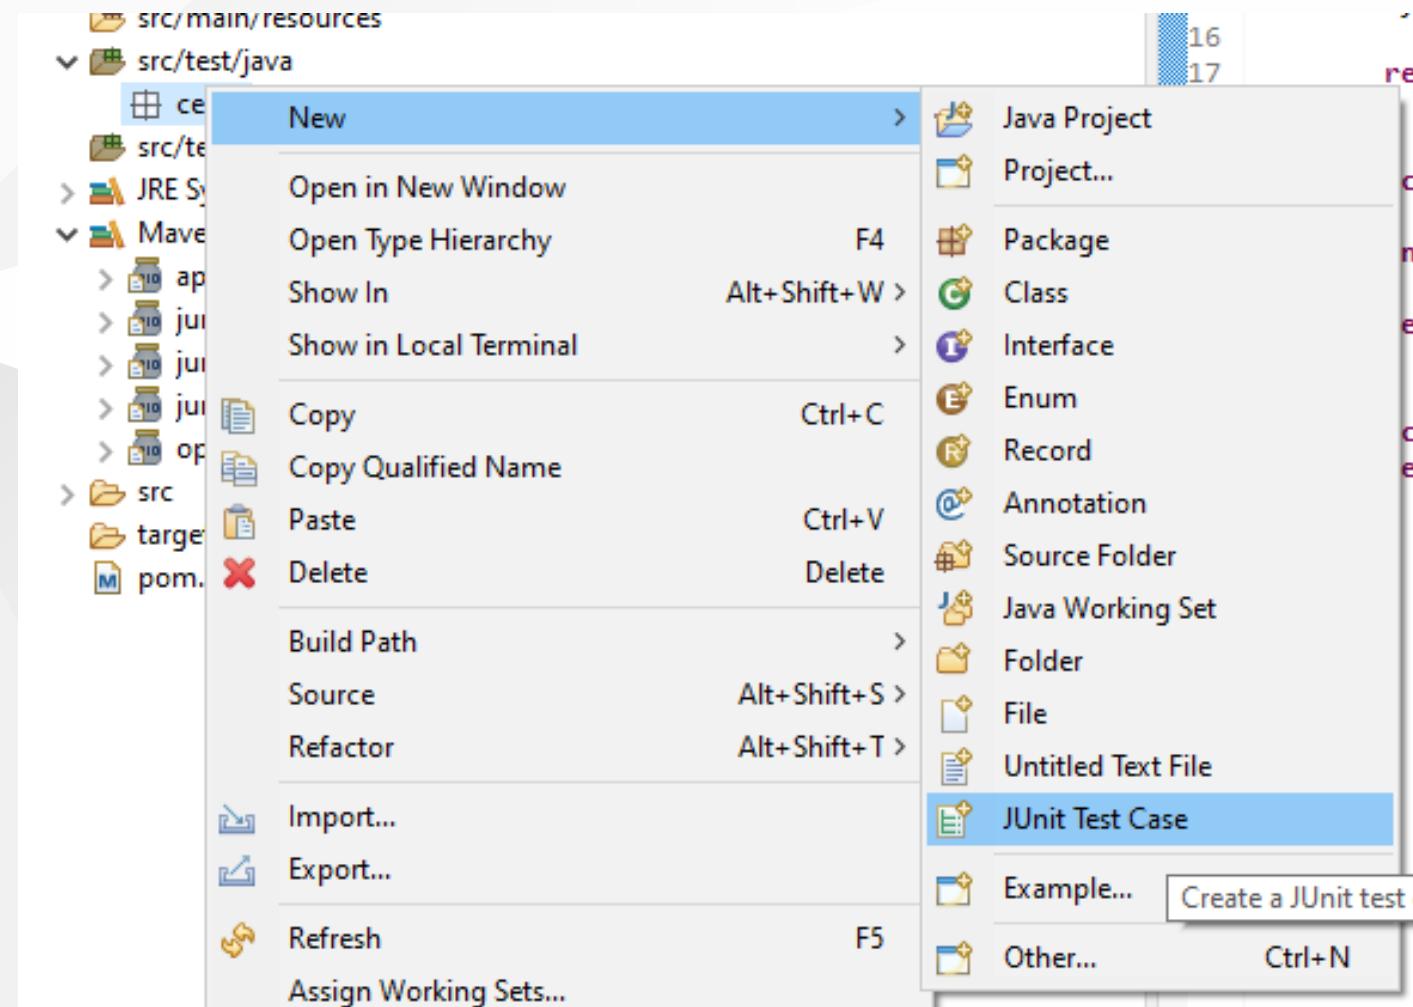

Now lets create tests inf src/test/java

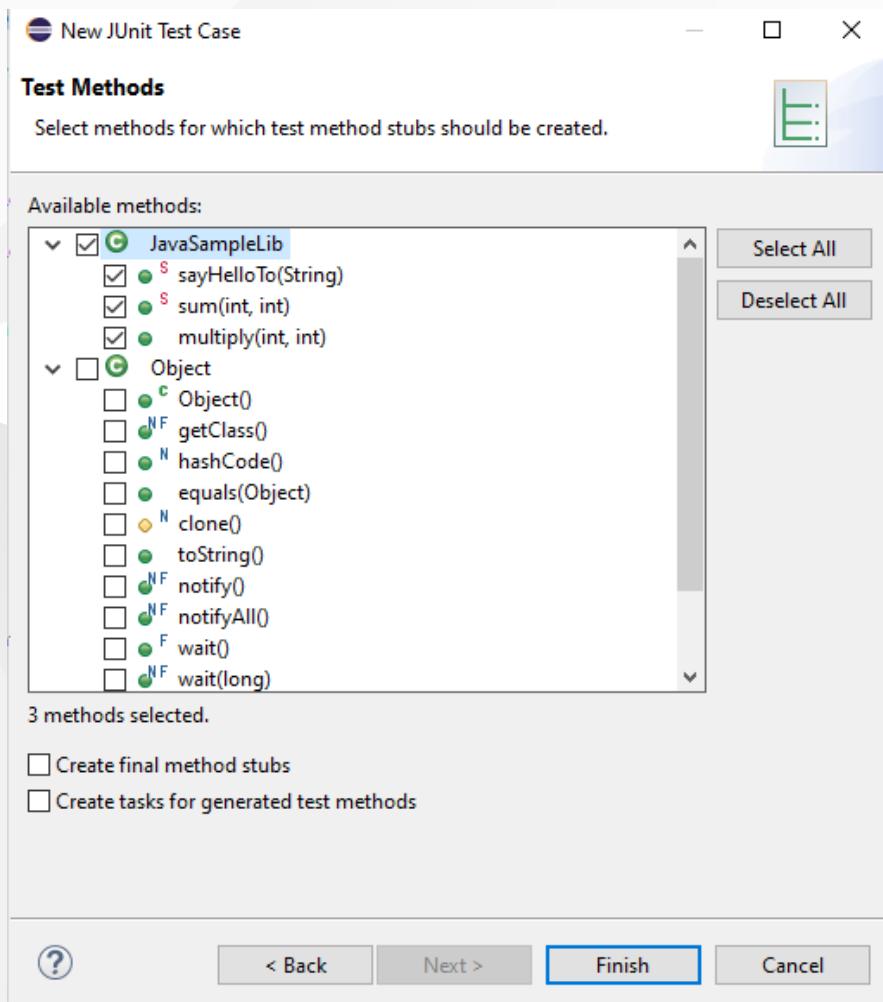

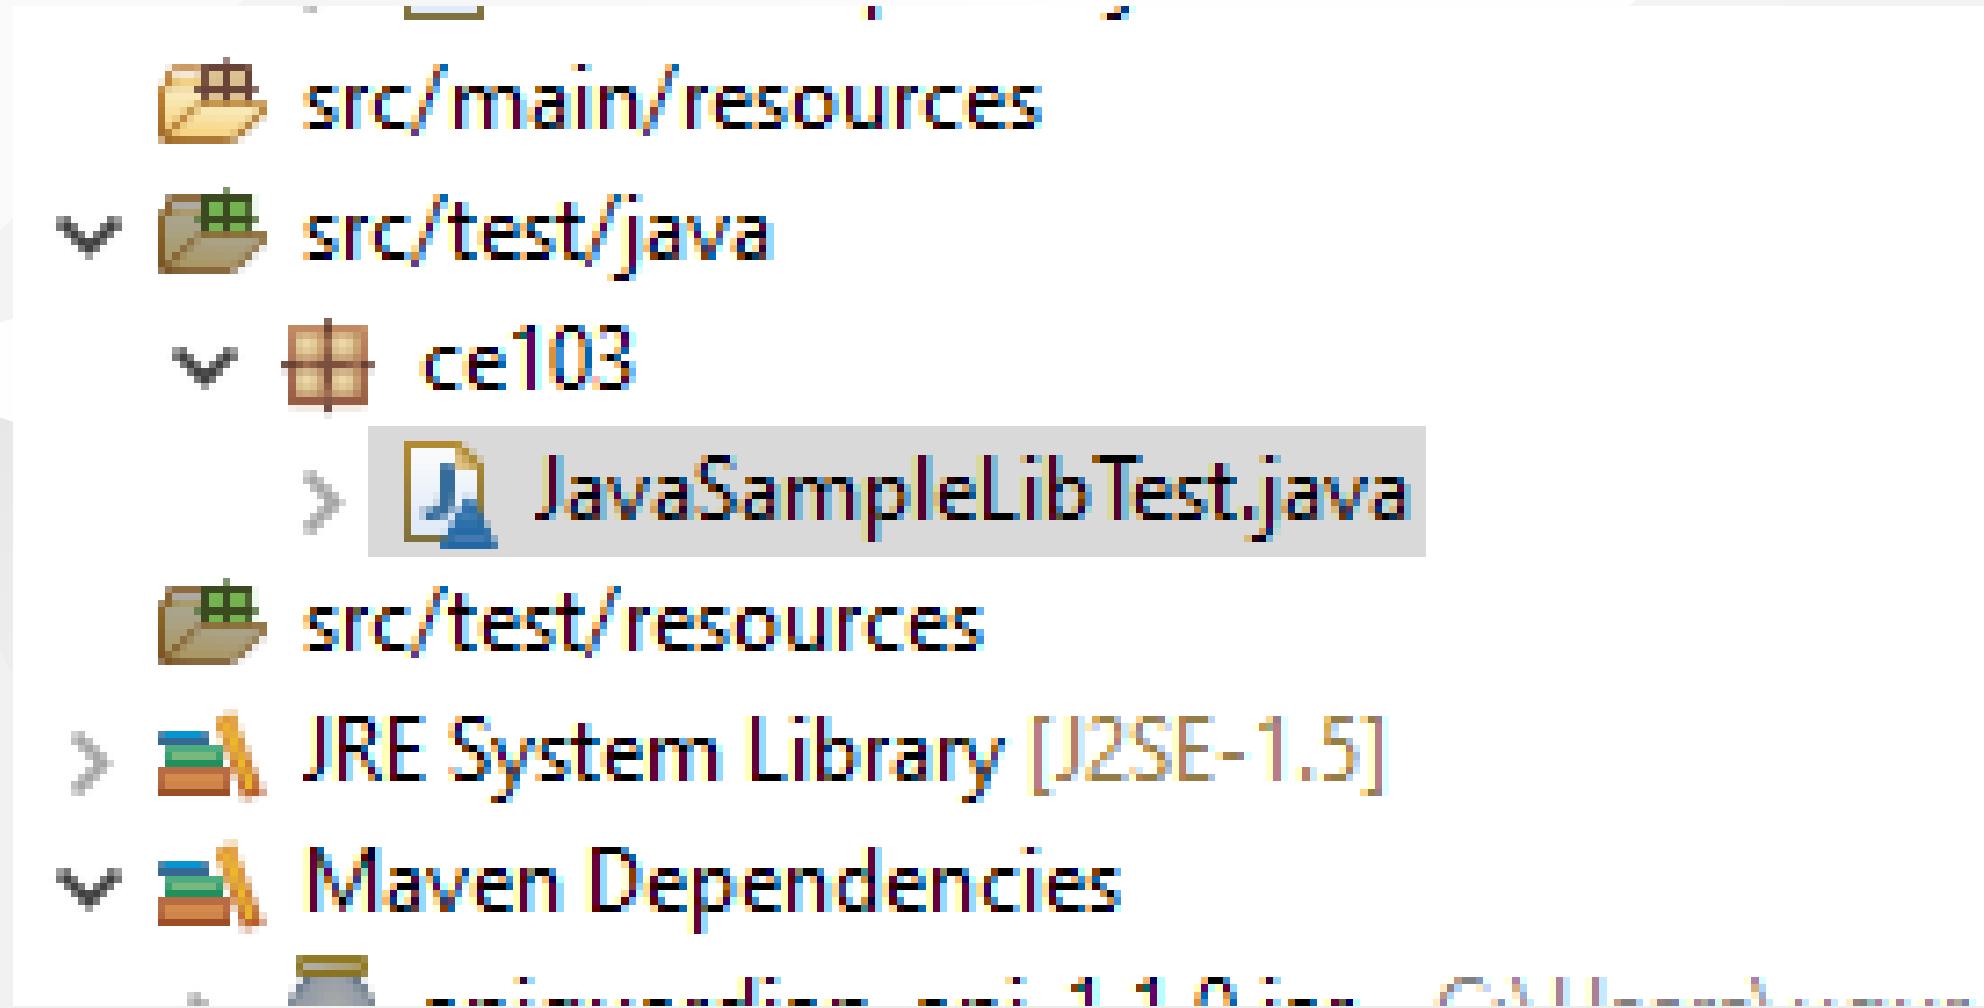

## create a JUnit Case

# you will simple template

```
package ce103;

import static org.junit.jupiter.api.Assertions.*;

import org.junit.jupiter.api.AfterAll;
import org.junit.jupiter.api.AfterEach;
import org.junit.jupiter.api.BeforeAll;
import org.junit.jupiter.api.BeforeEach;
import org.junit.jupiter.api.Test;

class JavaSampleLibTest {

    @BeforeAll
    static void setUpBeforeClass() throws Exception {
    }

    @AfterAll
    static void tearDownAfterClass() throws Exception {
    }

    @BeforeEach
    void setUp() throws Exception {
    }

    @AfterEach
    void tearDown() throws Exception {
    }

    @Test
    void testSayHelloTo() {
        fail("Not yet implemented");
    }

    @Test
    void testSum() {
        fail("Not yet implemented");
    }

    @Test
    void testMultiply() {
        fail("Not yet implemented");
    }
}
```

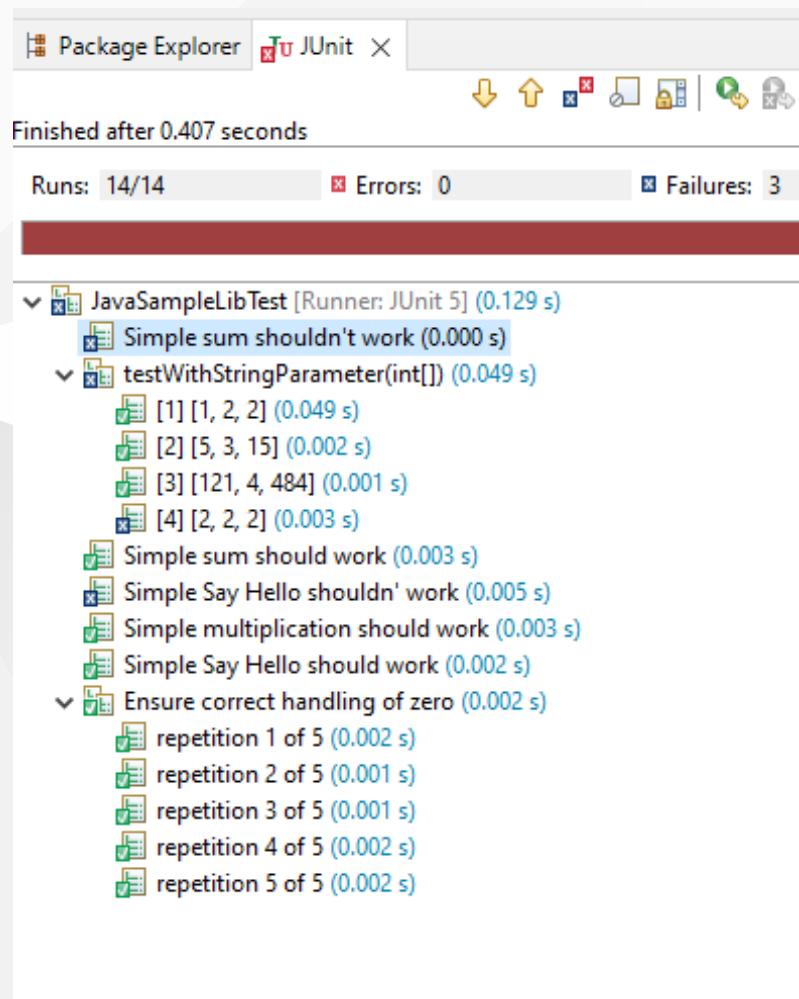

now lets copy tests from other projects

# Introduction to Code Reusability and Automate Testing

# Introduction to Code Reusability and Automate Testing

The screenshot shows the Eclipse IDE interface with the following components:

- Top Bar:** eclipse-workspace - java-sample-lib-ext/src/main/java/ce103/JavaSampleLib.java - eclipse IDE. Includes File, Edit, Source, Refactor, Navigate, Search, Project, Run, Window, Help.
- Toolbar:** Standard Eclipse toolbar with icons for file operations, search, and run.
- Package Explorer:** Shows JavaSampleLibTest [Runner: JUnit 5] (0.278 s) with 14/14 runs, 0 errors, and 3 failures.
- Java Sample Library Code:** JavaSampleLib.java containing methods for sayHelloTo, sum, and multiply.
- Failure Trace:** Details the failure: org.opentest4j.AssertionFailedError: Regular sum shouldn't work ==> expected: <10> | at ce103.JavaSampleLibTest.testSumWrong(JavaSampleLibTest.java:58).
- Coverage View:** Shows coverage details for JavaSampleLibTestExt (Oct 24, 2021 5:39:34 PM). The table below provides the data.

Element	Coverage	Covered Instructions	Missed Instructions	Total Instructions
java-sample-lib-ext	92.4 %	182	15	197
src/test/java	91.8 %	145	13	158
ce103	91.8 %	145	13	158
JavaSampleLibTest.java	91.8 %	145	13	158
src/main/java	94.9 %	37	2	39
ce103	94.9 %	37	2	39
JavaSampleLib.java	94.9 %	37	2	39

Thats a part of java unit testing...
